MF    C23 H22 O10

## \*\*PROPERTY DATA AVAILABLE IN THE 'PROP' FORMAT\*\*

The following are valid formats:

Substance information can be displayed by requesting individual fields or predefined formats. The predefined substance formats are: (RN = CAS Registry Number)

REG - RN  
 SAM - Index Name, MF, and structure - no RN  
 FIDE - All substance data, except sequence data  
 IDE - FIDE, but only 50 names  
 SQIDE - IDE, plus sequence data  
 SQIDE3 - Same as SQIDE, but 3-letter amino acid codes are used  
 SQD - Protein sequence data, includes RN  
 SQD3 - Same as SQD, but 3-letter amino acid codes are used  
 SQN - Protein sequence name information, includes RN  
 CALC - Table of calculated properties  
 EPROP - Table of experimental properties  
 PROP - EPROP and CALC

Any CA File format may be combined with any substance format to obtain CA references citing the substance. The substance formats must be cited first. The CA File predefined formats are:

ABS -- Abstract  
 APPS -- Application and Priority Information  
 BIB -- CA Accession Number, plus Bibliographic Data  
 CAN -- CA Accession Number  
 CBIB -- CA Accession Number, plus Bibliographic Data (compressed)  
 IND -- Index Data  
 IPC -- International Patent Classification  
 PATS -- PI, SO  
 STD -- BIB, IPC, and NCL  
 IABS -- ABS, indented, with text labels  
 IBIB -- BIB, indented, with text labels  
 ISTD -- STD format, indented  
 OBIB ----- AN, plus Bibliographic Data (original)  
 OIBIB ----- OBIB, indented with text labels  
 SBIB ----- BIB, no citations  
 SIBIB ----- IBIB, no citations

The ALL format gives FIDE BIB ABS IND RE, plus sequence data when it is available.  
 The MAX format is the same as ALL.  
 The IALL format is the same as ALL with BIB ABS and IND indented, with text labels.

For additional information, please consult the following help messages:

HELP DFIELDS -- To see a complete list of individual display fields.  
 HELP FORMATS -- To see detailed descriptions of the predefined formats.

AB The racemic title compds. e.g. binaphthols I (R1, R2 = H, alkyl, aryl, halo, formyl, hydroxy, alkoxy, PhS) are chirally separated with chirally resolving agents such as (S)-5-oxo-N-phenyl-2-pyrrolidinecarboxamide(II) in organic solvent (such as dichloromethane, chloroform, benzene, toluene, THF, ethanol, DMF, etc) at 0-150° for 1-12 h. Thus, refluxing [1,1'-binaphthalene]-2,2'-diol with II in EtOH-THF gave, after cooling, inclusion compound crystal. Refluxing the crystal with acetone gave, after cooling, (R)-I.

 AB Two new metabolites, for which the names kotanin (I) and demethylkotanin  
 (II) are suggested, were isolated from *Aspergillus glaucus* cultures.  
 spectral data on the metabolites and their basic hydrolysis products were  
 used to derive structures which were confirmed by total synthesis of  
 racemic I. Oxidative coupling of organocuprates served in the synthesis  
 of various biphenyls. Neither of the two metabolites seems to be  
 responsible for the toxicity of the total *A. glaucus* exts.

AB Attempts to sep. the major constituents of the phenolic fraction of the ether extract of the wood of *G. striata* were unsuccessful, but by chemical degradation and spectroscopic methods the structures of 4 of the components were deduced. They were mono- and di-Me ethers of 17,19,22,24-tetrahydroxy(14-p-o)cyclophane (I) with a double bond at either of 2 positions in the aliphatic chain. The new ring system was given the trivial name "turriane." Evidence that a 5th and a 6th component were derivs. with a saturated chain, and a 7th was a derivative of a double homolog of turriane, was obtained. Synthetic expts. connected with the structure determination, and on the synthesis of tetrahydroxyturriane (I)

are described. Possible biogenetic routes to striatol and the cyclophanes are discussed.

GI For diagram(s), see printed CA Issue.

AB cf. C.A. 52, 12836f. Picrolichenic acid (I), prisms, m. 187-90°

(decomposition) (aqueous AcOH), an intensely bitter compound isolated (5-7% yield)

from the dry powdered crustose lichen *Pertusaria amara*, occurring on the bark of oak and beech trees, by Et2O extraction and crystallization in the cold, has been

shown to have the structure (I) by decarboxylation of its piperide [2 interconvertible forms, m. 169-72° (C6H6) and 187-9° (decomposition) (aqueous AcOH) (di-Me derivative, prisms, m. 163-5° (MeOH)] to 2,4,6-C5H11(HO)(MeO)C6H2C6H(C5H11)(CO2H)(OH)2-2,3,4,6 (II), m.

145-8° (decomposition) (C6H6). I was purified by Al2O3 treatment and recrystn. from C6H6 or aqueous AcOH; it is soluble in most common organic solvents

except C6H6 and petr. ether. Brief (1 min.) treatment of I with CH2N2 in the cold gave Me picrolichenate, needles, m. 102-3.5° (MeOH), while prolonged (overnight) methylation with CH2N2 gave Me O-

methylpicrolichenate, needles, m. 80-2° (C<sub>6</sub>H<sub>14</sub>). Simultaneous decarboxylation and demethylation of II gives 2,2'-diamyl-4,4',6,6'-tetrahydroxybiphenyl (III), needles, m. 180-1° (glacial AcOH) (tetra-Me ether, m. 34.5-5.5° (MeOH); dibromo derivative, m. 119.5-20.5° (glacial AcOH); tribromo derivative, m. 106-7° (glacial AcOH); tetrabromo derivative, m. 97-8° (glacial AcOH)). III was identified by dehydration with ZnCl<sub>2</sub> at 240-50° to 3,7-dihydroxy-1,9-diamyldibenzofuran (IV), m. 124-5° (C<sub>6</sub>H<sub>6</sub>-petr. ether), which was methylated [di-Me ether of IV, needles, m. 72-3° (aqueous AcOH)] and oxidized by 20% KMnO<sub>4</sub> solution to

3,7-dimethoxydibenzofuran-1,9-dicarboxylic acid [di-Me ether, needles, m. 191-3.5° (EtOH)]. Infrared and ultraviolet absorption spectra further support the structures given. The unique structure of I combines features of the depsidones and of usnic acid and is comparable to the fungal metabolite griseofulvin which contains a similar spiran structure. The theory of oxidative coupling of phenols provides a common basis for a rational interpretation of the biosynthesis of dibenzofuran-like compds. from simple phenolic progenitors.

L18 ANSWER 1 OF 87 CAPLUS COPYRIGHT 2008 ACS ON STN

AB The subject invention concerns a method of inhibiting respiratory  
syncytial virus (RSV) infection in a patient by decreasing the endogenous  
protein kinase C (PKC) activity within the patient. Preferably, the  
preventative and therapeutic methods of the present invention involve  
administering a PKC inhibitor, to a patient in need thereof. The present  
inventor has determined that decreasing normal endogenous PKC activity is  
inhibitory to RSV infection of human cells. The subject invention also  
pertains to pharmaceutical compns. containing a PKC, inhibitor and a  
pharmaceutically acceptable carrier.

AB Using the "lactone concept", differently substituted AB-biaryl fragments (I; R = Me, t-Bu) of vancomycin have been synthesized atroposelectively. Their otherwise configurational instability was remedied by inclusion of two chlorine atoms in the B ring to give (II). Starting from a still configurationally unstable lactone-bridged precursor, we obtained this biaryl with high atroposelectivity (dr 94:6) by ring cleavage with dynamic kinetic diastereomeric resolution

I

AB The first total synthesis of three naturally occurring cyclophane derivs., e.g I, belonging to the turriane family of natural products is described. Their sterically hindered biaryl entity is formed by reaction of the Grignard reagent derived from an aryl bromide with an oxazoline derivative, and the macrocyclic tether of the targets is efficiently forged by ring closing metathesis. While conventional RCM catalyzed by the ruthenium-carbene complexes invariably leads to the formation of mixts. of both stereoisomers with the undesirable (E)-alkene prevailing, ring closing alkyne metathesis (RCAM) followed by Lindlar reduction of the resulting cycloalkynes opens a convenient and stereoselective entry into this class of compds. RCAM can either be accomplished by using the tungsten alkylidyne complex [(tBuO)3W.tplbond.CCMe3] or by means of a catalyst formed in situ from [Mo(CO)6] and para-trifluoromethylphenol. The latter method is significantly accelerated when carried out under microwave heating. Furthermore, the judicious choice of the protecting groups for the phenolic hydroxy functions turned out to be crucial. PMB-ethers were found to be compatible with the diverse reaction conditions en route to the targets; their cleavage, however, had to be carried out under carefully optimized conditions to minimize competing O-C PMB migration. The prepared turrianes are shown to be potent DNA cleaving agents under oxidative conditions when administered in the presence of copper ions.

I

AB The atropo-enantioselective total synthesis of the axially chiral bicoumarin (+)-isokotatin A (I) is described. Key steps were the formation of a configurationally stable seven-membered biaryl lactone and its kinetic resolution by atroposelective ring cleavage. The previous assignment of the absolute configuration (M-atropoisomer) of I (and its synthetic precursors) was confirmed by quantum chemical CD calcs.

AB In connection with the synthesis of 4,4',7,7'-tetramethoxy-5,5'-dimethyl-6,8'-bicoumarin (desertorin C) in enantiopure form, the diastereomeric ratios of the products of the reactions between 2-isopropoxy-6-methoxy-4-methylphenylmagnesium bromide and (4S)-4-isopropyl-2-(2,3,5-trimethoxyphenyl)-4,5-dihydrooxazole, between 2,4-dimethoxy-6-methylphenylmagnesium bromide and (4S)-4-isopropyl-2-(2,3-dimethoxy-5-methylphenyl)-4,5-dihydrooxazol, and between 2,4-dimethoxy-6-(*t*-butyldimethylsilyloxy)methylphenylmagnesium bromide and the oxazole (I) were explored. The major product of the last mentioned reaction was converted into (S,4S)-4-isopropyl-2-(2'-hydroxymethyl-4',6,6'-trimethoxy-4-methyl-1,1'-biphenyl-6-yl)-4,5-dihydrooxazole, the axial configuration of which was confirmed by single crystal X-ray structural determination The similar

product (S,4S)-2-(2',4',6-trimethoxy-4,6'-dimethyl-1,1'-biphenyl-6-yl)-4,5-dihydrooxazole was converted into (S)-1-(2,4',6'-trimethoxy-4,6'-biphenyl-2-yl)ethanone (II) which furnished (S)-1-(2',4',6-trimethoxy-4,6'-dimethyl-1,1'-biphenyl-2-yl)acetamide (43%) and (S)-2,7'-dimethoxy-3',5',6'-trimethyl-spiro[cyclohexa-2,5-die ne-1,1'-(1H)isindole]-4-one (III) (30%)

on Schmidt rearrangement. III on reduction and methylation regenerated II. The methodol. of Lipschutz was adapted for the synthesis of both enantiomers of 1,1'-(2',4'-dihydroxy-6,6'-dimethoxy-2,4'-dimethylbiphenyl-3,3'-diyl)bisethanone which constitutes a formal synthesis of both enantiomers of desertorin C.

AB The functional disturbance of microvasculature is recognized as an initiating mechanism that underlies the development of various diabetic complications. Although a causal relationship between microvascular leakage and tissue damage has been well documented in diabetic kidneys and eyes, there is a lack of information regarding the barrier function of coronary exchange vessels in the disease state. The aim of the present study was to evaluate the permeability property of coronary microvessels during the early development of exptl. diabetes with a focus on the protein kinase C (PKC)-dependent signaling mechanism. The apparent permeability coefficient of albumin (Pa) was measured in isolated and perfused porcine coronary venules. The administration of high concns. of D-glucose induced a dose-dependent increase in the Pa value, which was prevented by blockage of PKC with its selective inhibitors bisindolylmaleimide and Goe 6976. More importantly, an elevated basal permeability to albumin was observed in coronary venules at the early onset of streptozotocin-induced diabetes. The hyperpermeability was corrected with bisindolylmaleimide and the selective PKCβ inhibitor hispidin. Concomitantly, protein kinase assay showed a high PKC activity in isolated diabetic venules. Immunoblot anal. of the diabetic heart revealed a significant subcellular translocation of PKCβII and PKCε from the cytosol to the membrane, indicating that the specific activity of these isoforms was preferentially elevated. The results suggest that endothelial barrier dysfunction attributed to the activation of PKC occurs at the coronary exchange vessels in early diabetes.

AB Protein kinase C (PKC) isoenzymes constitute a family of at least 12 structurally related serine-threonine kinases that are differentially regulated and localized, and are presumed to mediate distinct intracellular functions. To explore their roles in intact cells, investigators are developing cell-permeable, isoform-selective inhibitors. 2,2',3,3',4,4'-Hexahydroxy-1,1'-biphenyl-6,6'-dimethanol di-Me ether (HBDDE) is reported to be a selective inhibitor of PKC  $\alpha$  and  $\gamma$  with  $ic_{50}$  values of 43 and 50  $\mu$ M, resp., using an in vitro assay. However, data examining the potency and selectivity of HBDDE in intact cells are lacking. Employing rodent cerebellar granule neurons as a model system, we investigated the effects of HBDDE using cell survival as a functional end-point. HBDDE induced an apoptotic form of cell death that was dependent upon protein synthesis and included activation of a terminal executioner of apoptosis, caspase 3. The concentration of HBDDE required for half-maximal cell death was less than 10  $\mu$ M (.apprx.5-fold less than the reported  $ic_{50}$  values for PKC  $\alpha$  and  $\gamma$  in vitro). Furthermore, HBDDE induced apoptosis even after phorbol-ester-mediated down-regulation of PKC  $\alpha$  and  $\gamma$ , indicating that this effect is independent of these isoforms. Consistent with this, 2-[1-(3-dimethylaminopropyl) indol-3-yl]-3-(indol-3-yl)-maleimide (GF 109203X), a general inhibitor of all classical and some novel PKCs, did not interfere with survival. Thus, HBDDE should not be used as an isoform-selective inhibitor of PKC  $\alpha$  or  $\gamma$  in intact cells. Nevertheless, identification of its target in granule neurons will provide valuable information about survival pathways.

AB O-Halosubstituted aromatic triazenes I (X = H, Br, Cl, F, I) react with aryloxides ArOH (Ar = Ph, 4-MeC<sub>6</sub>H<sub>4</sub>, 2-ClC<sub>6</sub>H<sub>4</sub>, 4-methyl-2-chlorophenyl) in the presence of CuBr·Me<sub>2</sub>S, K<sub>2</sub>CO<sub>3</sub> and pyridine in acetonitrile at reflux to afford biaryl ethers II. This general methodol. was applied to the construction of the C-O-D and D-O-E vancomycin model systems III and IV, resp., demonstrating its potential in a projected total synthesis of vancomycin. For the construction of the vancomycin model AB biaryl ring system, a sequential strategy involving a Suzuki coupling of the C-O-D aryl iodide V and boronic acid VI, followed by macrolactamization was demonstrated, in which the preformed C-O-D ring framework served to preorganize the precursor for cyclization. The latter investigation led to Suzuki-coupling-based asym. synthesis of biaryl systems in which 2,2-bis(diphenylphosphino)-1,1'-binaphthyl (BINAP) was found to be the optimum ligand.

AB 96 *Alternaria* strains isolated from diseased rinds of wheat, potato and eggplant were screened for toxigenicity of alternariol (AOH) and its methyl ether (AME) by the growth inhibition of *Bacillus mycoides*. 48 Strains (50%) exhibited toxic effects on *B. mycoides*. Examined by HPLC, 13 among 18 strains with moderate to high toxicity produced AOH and AME. More *A. solani* strains were toxic, but *A. alternata* produces more toxin. The most productive *A. alternata* XA-8 and *A. solani* SA-10 strains produced 280 and 95.5mg/kg AOH, and 5140 and 94.3 mg/kg AME.

AB A practical method is presented for an asym. synthesis of axially chiral 1,1'-biphenyl-2-carboxylates via the ester-assisted nucleophilic aromatic substitution reaction. Thus, upon treatment of 2-tert-butylphenyl 2-[(-)-menthoxy]benzoates (I; R1= Me, MeO) with an aryl Grignard reagent, chirality of the leaving (-)-menthoxy group is transferred to the newly formed biphenyl linkage with up to 94% optical yield.

AB A convenient synthesis of ( $\pm$ )-deoxyschizandrin (I) was achieved through the key step of reductive coupling of the bisacetonylbiphenyl I ( $R = CH_2COMe$ ,  $R_1 = Me$ ). The latter compound was synthesized by oxidative cleavage of the bis olefin I ( $R = CH_2CMe:CH_2$ ,  $R_1 = Me$ ) formed by Claisen rearrangement of the bismethallyl ether of 2,2',4,4'-tetramethoxybiphenyl-3,3'-diol. The synthesis of 2,2',4,4'-tetramethoxy-6,6'-di(prop-1-enyl)biphenyl-3,3'-diol I ( $R = CH:CHMe$ ,  $R_1 = H$ ) (II) is also described. The diphenolic oxidation of II did not lead to products with  $\beta,\beta'$  carbons linked.

AB Previously some ellagitannins were shown to be potent inhibitors of protein kinase C (PKC). On the basis of this finding, several series of ellagic acid (I) hexahydroxybiphenyl derivs. were synthesized as simple analogs of these ellagitannins and were evaluated for their inhibitory effect against PKC. Compds. II and III were found to be potent inhibitors of PKC, while hexakis-(benzyloxy)biphenyl derivs. exhibited weak anti-PKC activity.

AB Two closely related routes to the perylenediacetate I ( R = Me, R1 = H), one involving Ullmann phenol coupling and the other by double oxidative coupling are described. Regioselective demethylation of I (R = Me, R1 = H) followed by methylation or vice versa yields I (R = H, R1 = Me) which, except for its side chains, structurally resembles some of the natural perylenequinones.

AB A successful palladium-catalyzed intramol. coupling of Ph rings corresponding to amino acids (R)-4-hydroxyphenylglycine and (S)-3,5-dihydroxyphenylglycine of vancomycin is achieved. Thus, esterification of 2,3,5-Br(MeO)2C6H2CO2H with N-tert-butoxycarbonyl-O,N-isopropylidene-(R)-(4-hydroxyphenyl)glycinol followed by palladium-catalyzed cyclization gave dibenzopyranone I (Boc = Me3CO2C). I was converted into the title biphenyl derivative II in 14 steps.

AB The asym. synthesis of vancomycin-related  $\alpha$ -azido arylglycines by direct azide transfer methodol. is reported. Procedures for the conversion of the azides to N-protected arylglycines are provided. Thus, oxazolidinone I (R = H) was enolized with KHMDS and then treated with trisyl azide and HOAc at  $-78^\circ$  to give triazene II, which underwent in situ triazene elimination at  $30^\circ$  to give 78% azide I (R = N<sub>3</sub>) with a stereoselection of 90:10 for S:R. The latter was hydrogenated over Pd/C in the presence of (Boc)<sub>2</sub>O (Boc = Me<sub>3</sub>CO<sub>2</sub>C) to give I (R = NHBoc), which was hydrolyzed to give arylglycine III.

AB A novel method for the preparation of 6-aryl-2,4-dimethoxybenzoic acids involves the Alder-Rickert reaction of 1,5-dimethoxycyclohexa-1,4-dienes and arylpropionic esters. This strategy has been extended to the synthesis of the mold metabolites alternariol (I) and Me trimethylaltenusinate (II).

AB Hydroxyphenethylamine derivs. I [R1 = OH, F, CH2R6, (un)substituted NH2; R2, R3 = H, F, Cl, Br, alkyl, NO2, cyano, (CH2)xR7, SR7; R1R2 = N:CHCH:CH, N:C(OH)CH:CH, NHCOCH2, o-NHC6H4; R4 = H; R5 = H, Cl; R6 = H, OH, alkyl, alkylsulfonyl; R7 = Ph, C6H4OH; Z = bond, C6H4, CH:CH, 1,4-cyclohexanediyl; Z1 = NH, O, S, SO2, CO, CH2, CONH, CO2; Z2 = (CH2)y, CO, CS, SO2, CH2CO, CHR8CH2, (R8R4 = CH2) CH2CH2 (un)substituted by 1-4 alkyls; Z3 = NR9 (R9 = H, alkyl), CH2, O, CO, S, SO2, bond; n, m = 1-4; x = 0-3; y = 1-3] were prepared. Thus, aldehyde II (R10 = CHO) was reduced by NaBH4 to give II (R10 = CH2OH), which was treated with SOCl2 to give II (R10 = CH2Cl). Cyanation of the chloride by NaCN in Me2SO gave II (R10 = CH2CN), which was reduced by BH3-THF to II (R10 = CH2CH2NH2). Condensation of the amine with PhCH2CH2NHCO(CH2)4CO2H using N,N'-carbonyldiimidazole in CH2Cl2 gave II [R10 = (CH2)2NHCO(CH2)4CONH(CH2)2Ph], which was reduced by BH3-THF to II [R10 = (CH2)2NH(CH2)6NH(CH2)2Ph]. Cleavage of the di-Me ether by 48% aqueous HBr containing H3PO2 gave the diamine III. I act on peripheral and/or central dopamine receptors, thereby lowering blood pressure, reducing heart rate, and increasing renal blood flow. Some I exhibit cardiostimulant and bronchodilator effects (no data).

AB In a study of pathways of metabolism of cannabinoids by microorganisms, in which olivetol served as an exptl. model of the n-pentylresorcinol moiety, *F. roseum* appeared to metabolize only the aromatic portion of the mol. *F. roseum* Was capable of biotransforming olivetol to form metabolites both more and less polar than the starting material. After a time-course study indicated the optimal length of incubation, a prepare-scale fermentation was performed to isolate sufficient quantities of metabolites for structure determination Two metabolites of olivetol were isolated and identified as mono-Me

olivetol and 2,2',4,4'-tetrahydroxy-6,6'-dipentylbiphenyl.

AB Following attack by nucleophiles, various methoxypyrylium compds. derived from 2H-pyran-2-ones and 4H-pyran-4-ones reacted either to produce enol ethers of linear  $\beta$ -polycarbonyl derivs. or to form methylene-2H-pyrans. The linear polycarbonyl derivs. underwent biomimetic cyclization to form polyketide aromatic systems. Treatment of the pyrylium salt I with EtO2CCH2PO(OMe)2 and NaH in THF at room temperature for 18 h gave 2,4,6-Me(MeO)2C6H2CO2Et.

AB The dibenzofuran condidymic acid (I) was prepared by unambiguous synthesis from 3,5-(MeO)2C6H3(CH2)4Me via the biphenyl II, and shown to co-occur with barbatic, thamnolic and didymic acids in *Cladonia squamosula*.

L18 ANSWER 50 OF 87 CAPLUS COPYRIGHT 2008 ACS on STN GI

AB Isolation and structures of two novel neolignans, asatone (I) and isoasatone (II), are described. The structure of II was established by x-ray crystallog. anal. of its dihydroxy derivative and chemical and spectral data. Thermal and photochem. reactions of these neolignans and their derivs. were carried out. Thus, asatone was photochem. converted into isoasatone.

AB Photolysis of several substituted 2-iododibenzylamine hydrochlorides in aqueous solution provided convenient syntheses of the corresponding 6,7-dihydro-5H-dibenz[c,e]azepines in useful yields. Thus, irradiation of o-IC6H4CH2NHCH2Pb gave 57% dibenzazepine I. Irradiation of o-IC6H4CH2NHCH2C6H3(OMe)2-3.5 yielded only 2,4,6-(MeO)2CHCHOCH2)C6H2C6H4CH2OH-o together with a small amount of dibenzoxepine II. Photolysis of three N-(2-halogenobenzyl)-β-phenethylamine hydrochlorides provided convenient syntheses of the corresponding 5,6,7,8-tetrahydrodibenz[c,e]azocines. Thus, irradiation of O-IC6H4CH2NHCH2CH2Pb gave 33% dibenzazocine III. NMR examination of the dibenzazocines confirmed that they existed in a skewed biphenyl conformation, and that inversion of the system by rotation through the planar biphenyl was hindered.

AB In contrast to static conditions oxidation of orcinol (I) by alkaline K3Fe(CN)6 in a flow system gave 35% dimer II (R = H) (III), smaller amts. of stereoisomeric trimers II [R = 6,2,4-Me(HO)2-C6H2] and stereoisomeric tetramers II [R = 3,2,4,6-R1Me(HO)2-C6H2, R1 = 6,2,4-Me(HO)2C6H2] (IV) and practically no polymers. Similarly, III gave 50% mixture of all diastereomeric IV. The exclusive o,o'-coupling found in all products was related to the spin distribution of the unpaired electron in the radical of I.

AB EPR spectra were measured during oxidation of 2-methyl-, 2-isopropyl-,  
2-butyl-, and 2-sec-butylhydroquinone in 20% aqueous KOH and aqueous MeOH-KOH.  
Iso-Pr, Bu, and sec-Bu derivs. gave primary radicals I which were  
gradually converted into the radicals II. The Me derivative underwent further  
oxidation to give the radical (III). The oxidation mechanism was discussed.

 AB Antibacterial tests against *Bacillus saprogenes*, which causes putrefaction of sake, were carried out on 22 diphenyl ether compds., 2 dibenzofuran compds., and 4 biphenyl compds. In diphenyl ether compds., 4 compds. with an OH group in 1 benzene ring and a Me in the other benzene ring, such as 2-hydroxy-2'-methylbiphenyl ether and 4-hydroxy-4'-methylbiphenyl ether, and a compound with a formyl and an OH in the same benzene ring, such as 4-formyl-2-hydroxybiphenyl ether, had antibacterial activity 4-8-fold that of salicylic acid and 2-4-fold that of Bu p-hydroxybenzoate. Substitution

of the Me group with carboxyl lowered the antibacterial activity. In biphenyl derivs., 2,2'- and 4,4'-di-hydroxybiphenyl had antibacterial activity 8-fold that of salicylic acid and 4-fold that of Bu p-hydroxybenzoate. Increasing nos. of OH groups lowered antibacterial activity. In dibenzofuran compds., 3,7-dihydroxydibenzofuran had twice the antibacterial activity of salicylic acid and was about comparable to Bu p-hydroxybenzoate. 3,7-Dihydroxy-1,9-dimethyldibenzofuran increased the antibacterial activity to 8-fold that of salicylic acid and 4-fold that of Bu p-hydroxybenzoate, showing that increased Me groups resulted in stronger antibacterial activity.

AB Arylbenzohydroquinones and arylquinones, depending on the redox potential, were obtained together with 2-acetylbenzohydroquinone when 2-acetyl-1,4-benzoquinone (I) or 2-methoxycarbonyl-1,4-benzoquinone were treated with phenols, phenol ethers, amines, or hydrocarbons, in the presence of acid catalyst, preferably HOAc, H<sub>2</sub>CO<sub>2</sub>, F<sub>3</sub>CCO<sub>2</sub>H, or silica. Reaction of I with orcin gave 2-acetyl-3,3',6,6'-tetrahydroxy-2'-methylbiphenyl, which was oxidized to 2-acetyl-3-(2,4-dihydroxy-6-methylphenyl)-1,4-benzoquinone with Ag<sub>2</sub>O. 2-Acetyl-3-(4-methoxy-2-methylphenyl)-1,4-benzoquinone was obtained directly and intermediate isolation of the hydroquinone was not possible. Thirteen other hydroquinones and 23 quinones were similarly prepared

 AB The toxicity of alternariol (I, R = H) (II) and its monomethyl ether (I, R = Me) (III) to the Japanese pear was studied. II and III were isolated from the dried mycelium by Et<sub>2</sub>O extraction or the cultural filtrate by CHCl<sub>3</sub> extraction after *A. kikuchiana* was cultured on potato medium containing 2% sucrose for 18 days at 25-8°. While II was inactive against young leaves of the Japanese pear, III caused necrotic lesions on young leaves of both resistant and susceptible varieties. IV and V, which are hydrolyzates of III, were toxic to both varieties.

AB cf. CA 60, 13119c. Equimolar (0.01M) solns. of 1,2,3(OH)2C6H3Pr-iso and 2,5-(HO)2C6H3Me stirred with 1.0N NaOH in the presence of air rapidly turned green and gave a relatively stable (half-life >24 hrs.) free radical signal in the E.P.R. spectrum. The total extracted phenolic mixture treated with Me3SiSiMe3 and the product analyzed by vapor phase chromatography showed the presence of only one product (I, R = H) (II) and the hydrolyzate of the trimethylsilyl ether (I, R = SiMe3) (III) gave an E.P.R. peak identical with that of the main product II. III, C25O4004Si3,  $\lambda$  313, 303, 295, 259 m $\mu$  (C6H12) showed N.M.R. signals at  $\tau$  8.63 d, 6.47 heptet (J 7.0), 3.53, 3.24 d (J 2.0), 7.39 s, 2.88 s. III heated with Ac2O and KOAc gave the corresponding acetate I (R = Ac), C22H22O7, m. 179-80°. The condensation was repeated in a limited supply of air, quenched with acid after 10 sec. and the trimethylsilyl ethers of the products analyzed by vapor phase chromatography to show the presence of 2 major product peaks corresponding to III and the trimethylsilyl ether (IV, R = SiMe3) (V) of the biphenyl derivative IV (R = H) (VI). Both V and the corresponding acetate IV (R = Ac) showed N.M.R. signals for 2 pairs of meta proton doublets, conclusively demonstrating the position of the C-C linkage in IV. The isolation of VI as an intermediate limits the structure of the dibenzofuran to I and an alternate (VII), which was excluded since the dibenzofuran gave a neg. Gibbs test. The E.P.R. spectrum of the radical anion of II consists of a quartet with intensity ratios 1:3:3:1 due to a hyperfine coupling to 3 equivalent protons with a coupling constant 1.22 oe. Each of these lines is split into a doublet by a single proton with a coupling constant 0.56 oe., and each of these is again split into 3 lines with intensity ratios 1:2:1 and coupling constant 0.13 oe., indicating coupling to 2 equivalent protons. The hyperfine couplings were assigned with the aid of deuterium analogs. The quartet was assigned to the Me group, the doublet to H-9, and the triplet to H-2 and H-4. No hyperfine coupling from the iso-Pr group was observed. The formation of dibenzofuran through mixed condensation reaction of catechols and resorcinols was found to be quite general though self-condensation was scarcely observed, if at all.

AB [2,6,4-RMe(MeO)C6H2]2(I) (R = NH2) (II) was separated with tartaric acid (III) into its antipodes. The absolute configuration of optically active II was determined by comparison of the optical rotatory dispersion and circular dichroism with (-)-(S)-[2,6-RMeC6H3]2 (IV) (R = NH2) (IVa) and their derivs. [(+)-(S)-I (R = NHAc) (V) with (+)-(S)-IV (R = NHAc) (VI) and (+)-(S)-I (R = N:CHC6H4OH-2) (VII) with (+)-(S)-IV (R = N:CHC6H4OH-2) (VIII)]. The results showed that both (+)-VII and (+)-VIII and also (-)-II and (-)-I have the same configuration. Since the configuration of (-)-IVA has been determined by chemical means as (S) (Mislow, CA 53,10134i),

(-)-II must also have the (S) configuration. (All m.ps. are corrected). A solution of 200 mg. [2,4,6-MeR(MeO)C<sub>6</sub>H<sub>2</sub>]<sub>2</sub> (IX) (R = NH<sub>2</sub>) (X) in 6 cc. H<sub>2</sub>O, 0.2 cc. concentrated HCl, and 0.3 cc. concentrated H<sub>2</sub>SO<sub>4</sub> decolorized with C, diazotized with 103 mg. NaNO<sub>2</sub> in 5 cc. H<sub>2</sub>O at 0°, added dropwise to a hot (100-10°) solution of 8 cc. concentrated H<sub>2</sub>SO<sub>4</sub> and some CuSO<sub>4</sub> in 20 cc. H<sub>2</sub>O, filtered while hot, coded, and let stand for a long time and the precipitate filtered and crystallized from H<sub>2</sub>O gave after drying in vacuo at 100° hydrated IX (R = OH) (XI), m. 164-5°, which sublimed in vacuo at 150° gave 60 mg. anhydrous XI, m. 200-2°. A solution of 2.123 g. (+)-(R)-Iva, [α]<sub>D</sub> 80.0° (c 1, Me<sub>2</sub>CO); .apprx.80% optical purity in 50 cc. 2N H<sub>2</sub>SO<sub>4</sub> and 6 g. concentrated H<sub>2</sub>SO<sub>4</sub> diazotized with 1.4 g. NaNO<sub>2</sub> at 0°, added dropwise to 150 cc. hot (110°) 50% H<sub>2</sub>SO<sub>4</sub>, coded, and extracted with Et<sub>2</sub>O, the Et<sub>2</sub>O solution extracted with 2N

NaOH, the alkaline solution acidified, the reddish precipitate (1.05 g.) filtered and dissolved in alkaline solution, the solution treated at 80° with Na<sub>2</sub>S<sub>2</sub>O<sub>4</sub> (to remove azo dyes present), acidified, and extracted with Et<sub>2</sub>O, the extract evaporated,

and the residue recrystd. twice from C<sub>6</sub>H<sub>6</sub> gave 542 mg. (+)-(R)-IV (R = OH) (XII), m. 157-8°, [α]<sub>D</sub> 82.0° (c 1.0, Me<sub>2</sub>CO), 77.8° (c 0.6, EtOH). H<sub>2</sub>O, the solution poured into 10 cc. ice cold 30% H<sub>3</sub>PO<sub>2</sub>, refrigerated 18 hrs., and let stand 24 hrs. at room temperature, the precipitate filtered and dissolved in C<sub>6</sub>H<sub>6</sub>-petroleum ether, the solution washed with 10% aqueous NaOH and H<sub>2</sub>O and evaporated, and the residue chromatographed on neutral silica gel with C<sub>6</sub>H<sub>6</sub> gave 53 mg. (±)-XII, m. 120-2° (EtOH-dilute AcOH, sublimation in vacuo at 80°), which (107 mg.) methylated with 200 mg. Me<sub>2</sub>SO<sub>4</sub> and 200 mg. K<sub>2</sub>CO<sub>3</sub> in 20 cc. Me<sub>2</sub>CO gave 93 mg. (±)-IV (R = OMe) (XIII), m. 126° (EtOH-H<sub>2</sub>O). Similar methylation of 107 mg. (+)-(R)-XII gave 60 mg. (+)-(R)-XIII, m. 85-7°, [α]<sub>D</sub> 52.7° (c 0.64, EtOH), at least 80% optical purity. Efforts to obtain the antipodes of (±)-X were unsuccessful, apparently because the salts of the antipodes differed too little in solubility and in crystal structure. To a stirred

solution

of 21.8 g. 3,5-O<sub>2</sub>N(MeO)-C<sub>6</sub>H<sub>3</sub>Me (XIIIa) in AcOH was added 3.3 g. NaOAc at room temperature (light excluded), followed dropwise 8 hrs. by 62 g. Br in 145 cc. Fe powder, after 1 hr. the solution poured into 1l. ice H<sub>2</sub>O and let stand several hrs., and the precipitate filtered, washed with H<sub>2</sub>O, dried, and recrystd. from 200 cc. cyclohexane with C to give 24.7 g. 2,3,5-Br(O<sub>2</sub>N)(MeO)C<sub>6</sub>H<sub>2</sub>Me (XIV), m. 78-82°, sufficiently pure for further reaction; anal. XIV m. 80-2° (MeOH, sublimation in vacuo at 60°), N.M.R. (CDCl<sub>3</sub>) showing doublet at 7.05 (1H) and 7.4 ppm. (1H) [J = 3 cycles/sec. (c.p.s.)] (2 aromatic protons in meta position to each other); the mother liquors concentrated and the residue investigated by gas chromatography (4-m. steel column with SE-52; 30 cc. N/min., 230°; injection block 330°) showed the presence of XIIIa, XIV, 4-Br analog (XIVa) of XIV, 2,4,3,5-Br<sub>2</sub>(O<sub>2</sub>N)MeO)C<sub>6</sub>HMe (XV), and an unidentified compound (XVI) (retention times = 5.0, 9.5, 10.0, 13.5, and 19 min.); a very weak peak (<0.1%) at 11 min. could be assigned to the 6-Br analog of XIV. This residue chromatographed on silica gel with cyclohexane-C<sub>6</sub>H<sub>6</sub> (initially 9:1, finally 1:1; 300 40-cc. fractions collected gave first XV followed by XIIIa with XIV and XIVa, while XVI appeared only after elution with C<sub>6</sub>H<sub>6</sub>. The comps. were all obtained anal. pure after recrystn. of the residues of the main fractions from cyclohexane (large losses); the proportion of the comps. in the mother liquor was 8:60:10:6:1 XIIIa-XIV-XIVa-XV-XVI. XIVa m. 105-6°. XV (3% yield) m. 155°. XVI, probably a dinitromethoxytoluene, m. 114-15°. In a larger experiment, chromatography of the mother liquors of XV gave 0.3% second dibromo

compound, probably 2,6-Br<sub>2</sub> analog of XV, m. 112-14°. A mixture of 10 g. XIV and 30 g. activated (with AcOH) Cu powder heated 2 hrs. at 200° and 3 hrs. at 230° (air excluded) and extracted with C<sub>6</sub>H<sub>6</sub> and the extract chromatographed on silica gel with C<sub>6</sub>H<sub>6</sub> gave from the first zone 4.8 g. I (R = NO<sub>2</sub>) (XVII), m. 115°. A mixture of 2.5 g. XIV and 3.5 g. Cu powder in 25 cc. PhNO<sub>2</sub> heated 6 hrs. at 190° and PhNO<sub>2</sub> steam distilled gave after chromatography (as above) 1 g. XVII, m. 113-15°. XVII (400 mg.) in 40 cc. warm MeOH hydrogenated over Raney Ni until the calculated amount H was absorbed gave 320 mg. (±)-II, m. 117-18°. A boiling solution of 8.2 g. (±)-II and 9.1 g. (-)-III in 40 cc. EtOH cooled slowly and let stand 24 hrs. and the precipitate repeatedly recrystd. from the smallest possible amount of 0.5M EtOH(-)-III gave after 4 crystns. .apprx.2 g. salt, [α]<sub>D</sub><sup>25</sup>365 .apprx.-21° (c 4, EtOH), optical purity .apprx.25%, and after 6 crystns. .apprx.0.6 g. salt, [α]<sub>D</sub><sup>25</sup>365 .apprx.-37°, optical purity .apprx.45%. This fraction dissolved in 2N HCl and the solution treated with dilute aqueous NH<sub>3</sub> with stirring and ice cooling gave 3-4% (-)-(S)-II, m. 134-6°, [α]<sub>D</sub><sup>25</sup>365 -167° (c 0.5, EtOH). Similar treatment of the free amine from all mother liquors with (+)III gave (+)-(R)-II, m. 134-6°, [α]<sub>D</sub><sup>25</sup>365 167° (c 0.5, EtOH). (±)-II (100 mg.) heated briefly with 2 cc. Ac<sub>2</sub>O, after several hrs. excess Ac<sub>2</sub>O decomposed with H<sub>2</sub>O, the solution evaporated in vacuo, and the residue dried (over KOH and chromatographed on silica gel with 4:1 C<sub>6</sub>H<sub>6</sub>-Et<sub>2</sub>O gave 122 mg. (±)-V, m. 63-8° (sublimation in vacuo at 120-30°). From (-)-(S)-II was similarly prepared 87% (+)-(S)-V, m. 70-5°, [α]<sub>D</sub><sup>25</sup>105° (c 0.7, EtOH). (±)-II (52 mg.) and 750 mg. 2-HOCH<sub>2</sub>CHO (XVIII) heated 30 min. at 180-90°, the product taken up in EtOH, and the solution diluted with petroleum ether gave 65 mg. (±)-VII, m. 169-71° (C<sub>6</sub>H<sub>6</sub>cyclohexane). A solution of 60 mg. (-)-(S)-II and 66 mg. XVIII in 3 cc. EtOH let stand 24 hrs. at room temperature deposited 89 mg. (+)-(S)-VII, m. 189-91°, [α]<sub>D</sub><sup>25</sup>500° (c 0.12, dioxane). (±)-II (170 mg.) in 4 cc. H<sub>2</sub>O and 0.4 cc. concentrated HCl treated at 0° with 86 mg. NaNO<sub>2</sub> in 0.5 cc. H<sub>2</sub>O, the solution poured into 10 cc. ice cold 30% H<sub>3</sub>PO<sub>4</sub>, kept 48 hrs. at 0° and 24 hrs. at room temperature, and extracted with EtOAc, the extract dried and evaporated, the residue chromatographed on silica gel with 1:1 C<sub>6</sub>H<sub>6</sub>-EtOAc, and the oily product from the first pale red zone distilled in vacuo at 80° gave 62 mg. (±)-IV (R = OMe) (XIX), m. 55°, identical (mixed m.p. and ir spectrum) with an authentic specimen. (±)-IVa (149 mg.) and 2.3 g. XVIII kept 20 min. at 185-90° and the mixture cooled and diluted with 8 cc. EtOH gave 240 mg. (±)-VIII, m. 234-6° (C<sub>6</sub>H<sub>6</sub>-EtOAc). Optically pure (-)-(S)-XIX (44 mg.) and 134 mg. XVIII in 5 cc. EtOH let stand 20 hrs. at room temperature gave 58 mg. (+)-(S)-VIII, m. 166°, [α]<sub>D</sub><sup>25</sup>627° (c 0.1, EtOH). The optical rotatory dispersion, circular dichroism, and uv spectra of (-)-(S)-IVa, (-)-(S)-II, (+)-(S)-V, (+)-(S)-VI, (+)-(S)-VII, and (+)-(S)-VIII were recorded.

AB cf. CA 65, 643b. Assignment of configurations was made for compds. synthesized earlier (loc. cit.). The assignments were usually made on the basis of vinyl C-H ir bands. For compds. of the formula R1CH:CHSR2 (R1 = substituted Ph, R2 = 2-imidazolyl or 2-benzimidazolyl) assignments were made on the basis of vinyl spin-spin coupling consts. Configuration was assigned for the following R1CH:CHSR2 (R1, R2, n, and configurations given): p-ClC6H4, p-ClC6H4, 0(2), cis (trans); p-ClC6H4, 2,4,5-Cl3C6H2, 0(2) cis (trans); p-ClC6H4, 2-thienyl, 0(2), cis (trans); 2,4,5-Cl3C6H2, 2-thienyl, 0(2), cis (cis); 2-thienyl, p-ClC6H4, 0(2), trans (trans); 2-thienyl, 2,4,5-Cl3C6H2, 0, cis; 2-thienyl, 2,4,5-Cl3C6H2, 2, trans; p-ClC6H4, 2-thiazolyl, 0(2), cis (cis); 2,4,5-Cl3C6H2, 2-thiazolyl, 0, cis; p-ClC6H4, 2-imidazolyl, 0, cis; 2,4,5-Cl3C6H2, 2-imidazolyl, 0, cis; p-ClC6H4, 2-benzimidazolyl, 0, cis; 2,4,5-Cl3C6H2, 2-benzimidazolyl, 0, cis.

AB cf. preceding abstract The mechanism of the formation of orcein dyes was elucidated and a reaction scheme presented. Hydroxyhydroquinones react with  $\text{NH}_3$  via 4-aminoresorcinols to give tetrahydroxydiphenylamines which are readily oxidized by air to indophenols. The indophenols add in alkaline solution resorcinol derivs. and eliminate  $\text{H}_2\text{O}$  with the formation of 2-hydroxyphenoxaz-2-one derivs.  $\beta$ - and  $\gamma$ -Hydroxyorceins and hydroxyresorceins substituted on the chromophore and on the ring-substituents by Me groups were prepared according to this scheme. 1,2,4-C $_6$ H $_3$ (OH) $_3$  (I) (100 mg.) in 20 cc. 1:1  $\text{NH}_4\text{OH}:\text{H}_2\text{O}$  heated 0.5 hr. at  $50^\circ$  and evaporated in vacuo, and the residue boiled 3 times with Et $_2\text{O}$  yielded from the extract 86.2 mg. light-gray, hygroscopic, air-sensitive product which was characterized as [2,4-(AcO)2C $_6$ H $_3$ ]2NH (II). A similar run with 2,3,5-(HO)3C $_6$ H $_2$ Me yielded 2,4,6-Me(HO)2C $_6$ H $_2$ NH $_2$  (III), isolated in 50% yield as [2,4,6-Me(AcO)2C $_6$ H $_2$ ]2NH, m.  $100^\circ$ . 2,4-(HO)2C $_6$ H $_3$ NH $_2$ .HCl (100 mg.) in a little  $\text{H}_2\text{O}$  shaken in the absence of O with about 1 g. Amberlite IR-4B (base) during 0.5 hr. yielded 63% viscous, light brown lacquer which was converted to II, m.  $162^\circ$ . [2,4-(HO)2C $_6$ H $_3$ ]2NH (30 mg.), some AcONa, and 2 cc. Ac $_2\text{O}$  refluxed 0.5 hr., and the crude product chromatographed on Al $_2\text{O}_3$  yielded 12.2 mg. N-Ac derivative of II, m.  $162^\circ$ . III.HCl (6.0 g.) in 500 cc.  $\text{H}_2\text{O}$ , 30 cc. N NaOH, and 100 cc. BuOH treated dropwise with stirring during 1.5 hrs. under N with 16.0 g. K $_3\text{Fe}(\text{CN})_6$  in 500 cc.  $\text{H}_2\text{O}$  and 20 cc. N NaOH and acidified, and 500 mg. of the residue (1.8 g.) from the BuOH phase chromatographed on silica gel yielded 200 mg. IV (R = Me, R' = OH, R'' = O). 2,3,4,6-Me(HO)3C $_6$ H $_2$ C $_6$ H $_2$ (OH)2Me-2,4,6 (IVa) (100 mg.) treated under N with 10 cc. 1:1  $\text{NH}_4\text{OH}:\text{H}_2\text{O}$ , purged 1 hr. with N, heated 6 hrs. at  $100^\circ$ , and evaporated, and the residue chromatographed on silica gel yielded 18 mg.  $\beta$ -V (R' = OH, R'' = O) (VI) [acetate, m.  $138-40^\circ$  (decomposition)] and 17 mg.  $\gamma$ -V [acetate, m.  $145-70^\circ$  (decomposition)]. I (200 mg.) and 8.0 g. orcinol in 100 cc.  $\text{H}_2\text{O}$  and 30 cc. 2N  $\text{NH}_4\text{OH}$  kept 36 hrs. in air, and the product mixture chromatographed twice on cellulose powder yielded 90 mg. dark red VII, decompose at  $350^\circ$  without melting. Crude VII (200 mg.) acetylated and chromatographed gave 70 mg. orange pentaacetate of VII, m.  $133-6^\circ$ . III.HCl (400 mg.) and 8.0 g. m-C $_6$ H $_4$ (OH) $_2$  in 170 cc.  $\text{H}_2\text{O}$  and 10 cc. 2N  $\text{NH}_4\text{OH}$  kept 3 days in air gave similarly 98 mg. dark red VIII, decompose at  $350^\circ$  without melting. VIII (30 mg.), some AcONa, and 2 cc. Ac $_2\text{O}$  heated 0.5 hr. on the water bath and chromatographed on silica gel gave 25 mg. orange pentaacetate of VIII, m.  $129-32^\circ$  (cyclohexane). III (109 mg.) in 5 cc. 1:1 C $_5$ H $_5$ N-Ac $_2\text{O}$  kept 24 hrs. at room temperature yielded 138 mg. 2,3,5-AcNH(AcO)2C $_6$ H $_2$ Me, m.  $159^\circ$  (CHCl $_3$ -C $_6$ H $_6$ ), which was also obtained in 55% yield from III.HCl. III (128 mg.), 150 mg. AcONa, and 10 cc. Ac $_2\text{O}$  refluxed 3 hrs. and chromatographed on silica gel gave 198 mg. 2,3,5-Ac $_2$ N(AcO)2C $_6$ H $_2$ Me, m.  $100.5^\circ$  (C $_6$ H $_6$ -cyclohexane). 3,5,2,4-(HO)2(O $_2$ N)2C $_6$ H $_4$ Me (214.1 mg.) in 3 cc. MeOH heated 1.5 hrs. with 1.489 g. SnCl $_2$ .2H $_2\text{O}$  in 3 cc. concentrated HCl and treated with H $_2$ S yielded 147.4 mg. 2,4,3,5-(H $_2$ N)2(HO)2C $_6$ H $_2$ Me.2HCl (IX.2HCl). IX.2HCl (50 mg.) treated 24 hrs.

at 20° with 4 cc. C5H5N-Ac2O gave 28.6 mg. 2,4,3,5-(AcNH)2(AcO)2C6HMe, m. 165-71° (C6H6-cyclohexane). IX.2HCl (100 mg.), 4 cc. Ac2O, and 150 mg. AcONa refluxed 4 hrs. and poured into 30 cc. H2O gave 162 mg. 2,4,3,5-(AcN2)2(AcO)2C6HMe (IXa), m. 137-8° (C6H6-cyclohexane). PhNH2 (3.726 g.) in 40 cc. 6N HCl diazotized with 3.0 g. NaNO2 in 15 cc. H2O, diluted with iced H2O to 150°, and added dropwise during 25 min. to 5.686 g. 3,5-(HO)2C6H3Me.H2O and 30 g. AcONa in 3 l. H2O, and the product chromatographed on silica gel yielded 7.473 g. orange 2,3,5-PhN:N(HO)2C6H2Me (X), m. 195-6° (dioxane-cyclohexane), and 632 mg. red 2,4,3,5-(PhN:N)2(HO)2C6HMe (XI), m. 234-5° (decomposition) (C6H6). X (247 mg.) treated at 60° with 600 mg. SnCl2 in 3 cc. concentrated HCl gave 185 mg. III.HCl which with Ac2O-AcONa yielded

214 mg. 2,3,5-Ac2N(AcO)2C6H2Me, m. 98-9° (C6H6-cyclohexane). XI (333.6 mg.) gave similarly 188.7 mg. IX.2HCl which was converted to 92.5% IXa, m. 137-8°. PhNH2 (93.2 mg.) in 2 cc. 6N HCl diazotized with 70 mg. NaNO2 in 1 cc. H2O, diluted with 40 cc. iced H2O and added dropwise during 20 min. with stirring at 0° to 246.3 mg. [2,4,6-Me(HO)2C6H2]2 (XII), and the crude product (275.3 mg.) chromatographed on silica gel yielded 7 fractions of 34.6, 2.3, 16.8, 1, 81.3, 7.3, and 110.0 mg., resp. Fraction 7 gave the red 5-PhN:N derivative (XIII) of XII, m. 230-1° (decomposition); fraction 5 yielded the red 5,5'-bis(phenylazo) derivative of

XII, charring at 285-90° (C5H5N-AcOEt); and fraction 1 gave the dark red 3,5,5'-tris(phenylazo) derivative of XII, blackens above 200°; fraction 6 gave orange rhombs which were not investigated further. 2-Hydroxy-6-methyl-5-(2-methyl-4,6-dihydroxyphenyl)-p-benzoquinone (XIV) (0.2-0.25 g.) in 50 cc. C6H6 shaken with 1-2 g. Zn dust and 5 cc. AcOH until colorless gave light brown IVa, m. 217-20° (sublimed at 150° in vacuo); 1.66 g. XIV gave in this manner 1.05 g. IVa. XIII (50.7 mg.), 5 cc. MeOH, 5 cc. H2O, and 4 cc. concentrated HCl heated 3 hrs. on the water bath with 80 mg. ZnCl2, and the product refluxed 0.5 hr. with AcONa and 2 cc. Ac2O yielded 40.3 mg. 2,3,4,6-Me(Ac2N)(AcO)2C6HC6H2(OAc)2Me-2,4,6 (XV), m. 133-4° (cyclohexane). IVa (100 mg.) in 10 cc. 1:1 NH4OH-H2O heated 7 hrs. under N on the water bath, and the crude product acetylated gave 113.7 mg. XV. The spectra of 7-hydroxy-2-phenoxazone (XVI), the 4,5-dimethyl derivative of XVI, and 3,5-(HO)2C6H3Me between 300 and 700 mμ are recorded.

AB cf. CA 64, 8351d. The mechanism by which 1,3,5-MeC6H3(OH)2 (I) is oxidized in alkaline solution by atmospheric O to the dimeric quinones II and III was

investigated by isolating intermediates chromatographically, by kinetic measurements, and by preparative studies with sterically hindered model compds. 1.H<sub>2</sub>O (5.1 g.) and 3.6 g. KOH in 85 cc. H<sub>2</sub>O, treated with stirring under N dropwise during 3.5 hrs. with 29.0 g. K<sub>3</sub>Fe(CN)<sub>6</sub> in 80 cc. H<sub>2</sub>O and acidified with 2N H<sub>2</sub>SO<sub>4</sub>, and the precipitate (2.8 g.) repptd. from EtOH with 2N H<sub>2</sub>SO<sub>4</sub>, gave the polymeric IV; the acidified filtrate extracted with BuOH, and the extract chromatographed on paper showed the presence of I, [2,4,6-Me(HO)2C6H2]2 (V), IV, and 4 phenolic compds. IV (500 mg.), 500 mg. Na, and 10 cc. dry C<sub>5</sub>H<sub>5</sub>N refluxed 6 hrs. under N, treated successively with 10 cc. 1:1 aqueous C<sub>5</sub>H<sub>5</sub>N and 10 cc. H<sub>2</sub>O, acidified with 50% H<sub>2</sub>SO<sub>4</sub>, and extracted with BuOH gave 57 mg. product mixture; the H<sub>2</sub>O-soluble portion of the mixture (40 mg.) sublimed at 120-80° in vacuo gave 8 mg. mixture of I and V. I. (1.0 g.) and 2.0 g. BzPh in 200 cc. C<sub>6</sub>H<sub>6</sub> under N irradiated with an immersed 125-w. uv lamp during 5 hrs. gave 830 mg. colorless solid and 1.0 g. BzPh; 2.0 g. colorless product chromatographed on cellulose powder, and the main product sublimed at 150-70° in vacuo yielded 40 mg. V, m. 232° (CHCl<sub>3</sub>). VI (R = Me) (198 mg.) and 2 g. dry C<sub>5</sub>H<sub>5</sub>N.HCl heated 2.5 hrs. at 180° under N gave 160 mg. (crude) hygroscopic VI (R = H) (VII), m. 80-1°. Crude VII (46 mg.), 1 cc. Ac<sub>2</sub>O, and 1 cc. C<sub>5</sub>H<sub>5</sub>N kept 3 hrs. at room temperature yielded 34.7 mg. 2,4,6-Me(AcO)2C6H2OC6H3(OAc)Me-3,5 (VIII), m. 81° (cyclohexane). VII (160 mg.), 80 cc. H<sub>2</sub>O, and 20 cc. 0.2M K<sub>2</sub>HPO<sub>4</sub> treated at 0° with stirring with 540 mg. NO(SO<sub>3</sub>K)<sub>2</sub> in 40 cc. 0.2M K<sub>2</sub>HPO<sub>4</sub>, acidified after 1 hr. with 2N H<sub>2</sub>SO<sub>4</sub>, and extracted with BuOH, and the residue from the extract (160 mg.) chromatographed on cellulose powder yielded some II and 20 mg. orange-brown IX, m. 137-9° (decomposition) (C<sub>6</sub>H<sub>6</sub>). IX (100 mg.), 2 g. Zn dust, and 0.5 g. AcONa in 10 cc. Ac<sub>2</sub>O refluxed until colorless gave 89 mg. 5-AcO derivative of VIII. The comparative autoxidn. of I and V demonstrated that V was oxidized nearly 10 times as fast as I. If the autoxidn. of I and V is performed in the presence of K<sub>3</sub>Fe(CN)<sub>6</sub>, in order to produce free orcinol radicals which are consumed immediately, the presence of V can be demonstrated chromatographically in the mixture, proving that V is not an intermediate in the oxidation of I to II and III. The autoxidn. of V proceeded without the formation of H<sub>2</sub>O<sub>2</sub>.

AB Resorcinol derivs. add in alkaline solution to hydroxyquinones to yield the corresponding dihydroxyarylhydroquinones. PhOH reacts in acidic and alkaline solution with p-benzoquinone (I) to give o-(II) and p-hydroxyphenylbenzoquinone (III); in neutral solution phenoxoquinones are also formed. The condensation of hydroxy-p-xyloquinone (IV) with BF<sub>3</sub> led to a dibenzofuranquinone, present in nonpolar solvents as diphenoxinone. m-C<sub>6</sub>H<sub>4</sub>(OH)<sub>2</sub> (1 g.) in 25 cc. 0.2M phosphate buffer (pH 12) and 4 cc. 2N NaOH treated dropwise with stirring in air with 100 mg. 1,2,4-C<sub>6</sub>H<sub>3</sub>(OH)<sub>3</sub> in 10 cc. H<sub>2</sub>O and acidified after 20 min. with dilute H<sub>2</sub>SO<sub>4</sub>, and the crude product chromatographed on silica gel yielded 38 mg. V (R = R<sub>1</sub> = R<sub>2</sub> = R<sub>3</sub> = H) (VI), dark brown needles, blacken up to 320° without melting. Similarly were prepared the following V (R, R<sub>1</sub>, R<sub>2</sub>, R<sub>3</sub>, % yield, and m.p. given): Me, H, Me, H, 92.5, 182-7° (decomposition); Me, Me, Me, Me, 90, 224-5°; tert-Bu, H, tert-Bu, H, 39.5, 225-7° (orange needles) (AcOEt cyclohexane); H, H, Me, H, 28, 190-200° (decomposition); Me, H, H, H, 11, 180-200° (decomposition). VI (125 mg.) in 5 cc. Ac<sub>2</sub>O heated 0.5 hr. on the water bath with NaOAc and Zn dust, and the product chromatographed on silica gel yielded 207 mg. 2,2',4,4',5-pentaacetoxybiphenyl (VII), m. 123-4° (cyclohexane-C<sub>6</sub>H<sub>6</sub>). Similarly were prepared the following derivs. of VII (substituent, % yield, and m.p. given): 6'-Me, 68, 136-9°; 6-Me, 84, 133-4°. 6-Hydroxytoluylhydroquinone (141 mg.) in 25 cc. 0.2M phosphate buffer (pH 12) stirred 1 hr. in air and acidified with dilute H<sub>2</sub>SO<sub>4</sub>, and the product chromatographed on silica gel yielded 91 mg. 4,4'-dihydroxy-2,2'-ditolylidiquinone, yellow needles, m. 207°. Similarly was prepared 4,4'-dihydroxy-3,3',6,6'-tetramethylbiphenyldiquinone, 68%, m. 208-10°. PhOH (5.64 g.) and 1.58 g. KOH in 20 cc. H<sub>2</sub>O treated with stirring with 0.648 g. I in 20 cc. H<sub>2</sub>O and acidified after 4 min. with dilute H<sub>2</sub>SO<sub>4</sub>, and the product chromatographed on silica gel yielded 5 mg.

5-PhO derivative (VIII) of 2-(p-hydroxyphenoxy)-1,4-benzoquinone (IX), light yellow needles, m. 224-6°, and 43 mg. III, m. 177° (C6H6-cyclohexane). PhOH (5.64 g.) in 35 cc. 20% H2SO4 and 7 cc. MeOH treated 0.5 hr. at 40° with 0.65 g. I yielded 103 mg. II, m. 192-3°, and 10 mg. III. I (3g.) and 18 g. PhOH in 850 cc. H2O and 150 cc. MeOH kept 20 days, and the crude product chromatographed on silica gel yielded 170 mg. yellow 2,5-diphenoxy-1,4-benzoquinone, m. 236-7° (cyclohexane), 95 mg. X, 220 mg. IX, 100 mg. VIII, yellow needles, m. 224-6° (AcOEt-cyclohexane), and 1.5 g. p-C6H4(OH)2. VIII (20 mg.) with 5 cc. Ac2O and 1 cc. C5H5N yielded 17 mg. acetate of VIII, yellow-green needles, m. 192-4° (C6H6). VIII (27 mg.) in 10 cc. Ac2O treated with 2 g. Zn dust yielded 22 mg. 2-(p-acetoxyphenoxy)-5-phenoxyhydroquinone diacetate, m. 102° (C6H6-cyclohexane). I (2 g.) in 200 cc. H2O and 25 cc. MeOH kept 9 days and acidified with dilute H2SO4 yielded 25 mg. IX, yellow needles, m. 145-6° (C6H6-cyclohexane). IX (216 mg.) and 2 g. PhOH in 150 cc. H2O and 25 cc. MeOH kept 13 days yielded 25 mg. VIII, yellow needles, m. 224-6° (AcOEt-cyclohexane). II (100 mg.) in 30 cc. dry Et2O treated 2 hrs. with 0.5 cc. Et2O.BF3 yielded 80 mg. 1,4,5,8-tetramethyl-3,6-dihydroxydibenzofuran-2,7-quinone (XI), black-blue needles, decompose slowly above 300° without melting up to 350° (AcOEt). II (150 mg.) in 15 cc. AcOH treated 4 hrs. at room temperature with 0.5 cc. concentrated

H2SO4 gave 102 mg. XI. XI (100 mg.) and a small amount NaOAc in 5 cc. Ac2O heated with the portionwise addition of 3 g. Zn dust until the mixture was colorless gave 116 mg. 1,4,5,8-tetramethyl-2,3,6,7-tetraacetoxydibenzofuran (XII), needles, m. 275-6° (C6H6). 2,7-Dihydroxy-4,5-dimethyldibenzofuran (30 mg.) in 10 cc. Ac2O and 1 cc. C5H5N heated 15 min. on the water bath, and the crude product chromatographed on silica gel yielded 34 mg. diacetate, needles, m. 181-2° (C6H6-cyclohexane). XI (100 mg.) in 100 cc. Me2CO and 5 cc. 2N HCl shaken with Zn dust until colorless gave 30 mg. 2,3,6,7-tetra-OH analog (XIII) of XII, needles, m. 285-300° (decomposition). The ultraviolet spectra of XI and XIII are recorded.

AB cf. CA 57, 11082b. Com. 2,3-Me2C6H3OH (I) coupled with diazotized 4-H2NC6H4SO3H (Ia) and the dye reduced with Na2S2O4 in alkaline solution gave 4-NH2 derivative (II) of I. Crude II (42.7 g.) in 250 cc. 35-8% aqueous HBF3 diazotized with 24 g. NaNO2 in 50 cc. H2O, the mixture stirred 30 min. at room temperature, the precipitate filtered, washed with a little aqueous HBF4, and

dissolved in 400 cc. MeOH by heating on a water bath, and the solution filtered and refrigerated gave 49.2 g. 2,3,4-Me2(HO)C6H2N2BF4 (III). III (15 g.) in 900 cc. MeOH acidified with 10 cc. concentrated MeOH-HCl and the solution irradiated 9 hrs. with an immersion lamp with cooling (N atm)., concentrated to 20 cc. (rotary evaporator), and cooled at -20° gave 6 g. 2,3,4-Me2(MeO)C6H2OH (IV), m. 96° (petr. ether). IV (1 g.) in 20 cc. MeOH treated with 10 cc. N KOH and the solution added rapidly with stirring to 5 g. K3Fe(CN)6 (V) in 50 cc. 0.5N KOH gave 0.9 g. crude 3,3',4,4'-tetramethyl-5,5'-dimethoxy-2,2'-diphenoquinone (VI). 3,3',4,4'-Tetramethyl-5,5'-dimethoxy-o,o'-biphenol (VII) (200 mg.) dissolved in 30 cc. hot MeOH and the solution cooled, and added to 1.5 g. V in 150 cc. 0.2N KOH with stirring gave 0.2 g. VI, blue violet, m. 118° (decomposition). Crude VI reduced with Na2S2O4 in EtOH gave 66% VII, m. 180° (MeOH with C). To 6.5 g. Na in 200 cc. liquid NH3 was added 10 g. 4-methoxy-1-naphthol, the NH3 evaporated at room temperature, the residue treated with 100 cc. H2O, and the solution heated to boiling with 5 g. C, filtered, and acidified with HCl to give 8 g. 5,6,7,8-tetrahydro-4-methoxy-1-naphthol (VIII), m. 117° (1:7 C6H6-petr. ether). VIII oxidized with V as above gave crude IX. Crude IX reduced with Na2S2O4 as above gave 4,4'-dimethoxy-5,5',6,6',7,7',8,8'-octahydro-2,2'-bi-1-naphthol (X), m. 211° (decomposed), reoxidized with V as above to pure IX, blue violet, m. above 150° (decomposition). Reduction of 4-methyl-1-naphthol with Na in liquid NH3 as above gave the 5,6,7,8-tetrahydro derivative, m. 90° which on oxidation gave a blue violet precipitate, which decomposed rapidly on crystallization from C6H6, washing with EtOH, or drying in vacuo. o-Cresol coupled with diazotized Ia, the dye reductively cleaved to 2,4-Me(H2N)C6H3OH, this diazotized, and

subsequently subjected to photodecompn. gave 2,4-Me(MeO)C<sub>6</sub>H<sub>3</sub>OH (XI), m. 70°. Treatment of XI as above gave neither a pure o,o'-diphenoquinone or o,o'-biphenol compound IX (200 mg.) in 10 cc. C<sub>6</sub>H<sub>6</sub> kept 24 hrs. in the dark, the solution evaporated, the residue reduced with Na<sub>2</sub>S<sub>2</sub>O<sub>4</sub> in EtOH, and the product crystallized from MeOH gave a mixture (XII) of 4,4'-dimethoxy-2,2'-bi-1-naphthol and X. XII in 80% EtOH oxidized with 2 g. FeCl<sub>3</sub> in 20 cc. 80% EtOH gave a blue precipitate of XIII from XII; X was not oxidized by FeCl<sub>3</sub> and remained in solution

AB cf. CA 59, 6546b. The constitution of I ( $\alpha$ -aminoorcein) was confirmed by unequivocal syntheses. m-AcNHC<sub>6</sub>H<sub>4</sub>Me brominated, and the resulting mixture of 2,6,3-Br<sub>2</sub>(AcNH)C<sub>6</sub>H<sub>2</sub>Me (II) and the 2,4,3-isomer fractionally recrystd. gave II, m. 142-3° (aqueous EtOH and C<sub>6</sub>H<sub>6</sub>). 2,3,5-I(MeO)C<sub>6</sub>H<sub>2</sub>Me(III) (556mg.), 1 g. Cu, and 680 mg. 2,6-dibromo-3,5-dinitrotoluene (IV) in 2 cc. PhNO<sub>2</sub> heated 1 hr. under N at 160°, filtered, and evaporated, and the residue chromatographed on silica gel yielded 82.4 mg. unreacted IV, 413.7 mg. 3-bromo-4,6-dinitro-2,4-dimethoxy-2,2'-dimethylbiphenyl (V), yellow prisms, m. 139° (sublimed in vacuo at 120°), 111.2 mg. 3,5-dinitro-2,6-bis(2,4-dimethoxy-6-methylphenyl)-toluene, yellow rectangles, m. 233-5° (C<sub>6</sub>H<sub>6</sub>), and 65.5 mg. crystals, m. 275-90°, which gave VI, orange-yellow rodlets (isomer A), m. 320-5° (decomposition) (C<sub>6</sub>H<sub>6</sub>), 6.9% isomer B, m. 265-73°, and 5 mg. isomer C of VI, decompose 300-40°. 2,3-H<sub>2</sub>N(HO)C<sub>6</sub>H<sub>3</sub>Me (VII) (883.1 mg.) in 5 cc. dry C<sub>5</sub>H<sub>5</sub>N treated below 50° with 5 cc. Ac<sub>2</sub>O and evaporated after 3 hrs. yielded 1.460 g. 2,3-AcNH(AcO)C<sub>6</sub>H<sub>3</sub>Me (VIIA), needles, m. 141-3° (sublimed in vacuo at 120°). IV (340 mg.) and 246 mg. VII in 4 cc. HCONMe<sub>2</sub> heated 5 hrs. under N at 130°, cooled, and treated with C<sub>6</sub>H<sub>6</sub> and dilute H<sub>2</sub>SO<sub>4</sub>, and the residue from the C<sub>6</sub>H<sub>6</sub> phase chromatographed on silica gel gave 218.6 mg. 5-bromo-2,4-dinitro-6,6'-dimethyl-2'-

hydroxydiphenylamine (VIII), red prisms, m. 136-7° (C6H6-cyclohexane). VIII (200 mg.) in 10 cc. Ac2O refluxed 15 min. with a small amount NaOAc while distilling off 5 cc. solvent, the mixture evaporated, and the

residue chromatographed on silica gel yielded 204 mg. N,O-di-Ac derivative (IX) of VIII, light yellow prisms, m. 190-1°. VIII acetylated similarly but in the absence of NaOAc yielded 11% IX and 41% O-Ac derivative of VIII, yellow rodlets, m. 171-2° (C6H6-cyclohexane). VII (246 mg.) and 251 mg. 2,6-dichloro-3,5-dinitrotoluene gave in the usual manner 138.7 mg. 5-Cl analog (X) of VIII, red needles, m. 160-1° (C6H6-cyclohexane). X (52 mg.) acetylated with Ac2O-Na-OAc yielded 50.2 mg. N,O-di-Ac derivative of X, m. 180-1° (C6H6-cyclohexane). IX (4.00 g.) and 3.80 g. III in 20 cc. Ph-NO2 heated 1.5 hrs. with stirring and treatment with N at 200°, cooled, filtered, distilled with steam, and the dried residue chromatographed on silica gel gave 0.87 g. unchanged III and 4.531 g. N,O-di-Ac derivative (XI) of 2,4-dinitro-5-(2,4-dimethoxy-6-methylphenyl)-6,6'-dimethyl-2'-hydroxydiphenylamine (XII), light yellow lacquer, m. 65-90°, containing 5% 2,4-dinitro-6,6'-dimethyl-2-acetoxy-N-acetyldiphenylamine. Crude XI (250 mg.), 15 cc. MeOH, and 5 cc. concentrated HCl refluxed 2 hrs. and evaporated, and the residue chromatographed on silica gel gave 159 mg. XII, orange-red needles, m. 89-95° (C6H6), which, in vacuo at 70°, lost 10% C6H6 to give XII, m. 88-90°. XI (4.00 g.) in 40 cc. Me2SO and 8 cc. 20% KOH-MeOH heated 20 min. at 70°, diluted with 200 cc. C6H6, treated with a little urea and then with dilute H2SO4, washed, dried, and evaporated, and the residue chromatographed on silica gel yielded 108 mg. 3-nitro-1,9-dimethylphenoxazine, red needles, m. 181-5° (C6H6-cyclohexane), and 2.40 g. XIII, yellow-brown needles, m. 210-14°, which changes at about 190° to a red modification, m. 213-15°; the red modification was also obtained by recrystg. the yellow-brown from a hot concentrated solution XII (100 mg.) gave analogously 57.3 mg. XIII. V (200 mg.)

and 200 mg. VIIA in 4 cc. HCONMe2 refluxed with 80 mg. K2CO3 and a little Cu powder, cooled, treated with 0.5 cc. 20% KOH-MeOH, and worked up, and the crude product chromatographed on silica gel gave 105 mg. viscous, yellow lacquer and 22.8 mg. XIII, brown needles, m. 210-14°; a similar run worked up without KOH yielded 14 mg. N-Ac derivative of XIII, light yellow leaflets, m. 229-31° (C6H6-cyclohexane). XIII (796 mg.) in 50 cc. AcOH refluxed 5 min. with 8.0 g. FeCl3.6H2O in 10 cc. AcOH, poured into 1.7 l. boiling H2O, refluxed again 5 min., diluted with 200 cc. 2N H2SO4, cooled, and filtered, and the residue chromatographed on silica gel yielded 659 mg. 7-nitro-1,9-dimethyl-8-(2,4-dimethoxy-6-methylphenyl)-3H-phenoxazin-3-one (XIV) (containing 0.5 mol. C6H6), m. 130-45°, resolidifying and remelting at 198°; XIV.1/2C6H6 recrystd. from EtOH gave XIV, orange-brown needles, m. 199-201°. XIV (250 mg.) in 5 cc. AcOH refluxed for 5 min. with a little Zn dust, filtered rapidly, treated with 162 mg. FeCl3.6H2O in 2 cc. H2O, diluted with hot H2O to 70 ml., and filtered, the filtrate neutralized with NH4OH and filtered, and the combined ppts. (248 mg.) chromatographed on silica gel yielded 199.7 mg. di-Me ether (XV) of I, violet-brown needles, m. 165-70°, which lost 5% by weight on drying in vacuo at 130° and then melted at 246-8° (decomposition), m. 246-9° (decomposition) (sublimed in vacuo at 170°). I (100 mg.) in 2 cc. HCONMe2 refluxed 1 hr. with 0.5 cc. 20% KOH-MeOH and 0.5 cc. Me2SO4, with the removal of 0.5 cc. solvent and evaporated in vacuo, and the residue dissolved in 200 cc. BuOH, washed, evaporated, and chromatographed gave 28.3 mg. XV, black-violet needles, m. 166-70°. XV (88.8 mg.) in 5 cc. C5H5N and 5 cc. Ac2O evaporated after 15 min., and the residue chromatographed gave 83.2 mg. acetate of XV, red crystals, m. 242-5°. XIV (300 mg.) in 10 cc. AcOH reduced with 400 mg. Zn dust, under N, treated with 4 cc. 20% HCl, evaporated to dryness in

vacuo under N, the light blue residue heated 1 hr. at 180° with 5 g. C5H5N.HCl, the melt dissolved in dilute H2SO4 and BuOH, treated with 200 mg. FeCl3.6H2O in 5 cc. H2O, anti the BuOH phase worked up yielded 86.3 mg. I, violet-black crystals with a greenish luster; the mother liquor gave a red-violet substance, presumably a mono-Me ether of I.

GI For diagram(s), see printed CA Issue.

AB The autoxidn. of 2,5,1,3-Me<sub>2</sub>(HO)<sub>2</sub>C<sub>6</sub>H<sub>2</sub> (I) in NH<sub>4</sub>OH yielded dyes analogous to those obtained from 3,5-(HO)<sub>2</sub>C<sub>6</sub>H<sub>3</sub>Me (II). The autoxidn. in aqueous KOH yielded, in addition to the dimeric mono- and diquinone, a trimeric diquinone which could not be identified with certainty in the product from II. The autoxidn. of I proceeds faster and furnishes better yields of the higher oxidized products which are more stable than those from II. I (14 g.) in 140 cc. concentrated NH<sub>4</sub>OH kept 25 days at room temperature in air while being treated

daily with dry  $\text{NH}_3$  during a few min., concentrated in vacuo over concentrated  $\text{H}_2\text{SO}_4$ , and dried over P205 yielded 16.8 g. crude, violet-black, amorphous powdery xylorcin which, extracted at about  $70^\circ$  with the upper phase of 5:1:2.6:5  $\text{C}_6\text{H}_6\text{-BuOH-AcOH-H}_2\text{O}$  and then chromatographed on cellulose powder, yielded 0.46 g. III ( $\text{R} = \text{OH}$ ) (IV), red-brown crystals, m.  $340^\circ$  (decomposition) ( $\text{MeOH-CHCl}_3$ ), 0.85 g. (crude) trans-V ( $\text{R} = \text{OH}$ ) (VI) (the OH groups on the benzene rings are in the trans configuration with respect to the phenoxazone plane), red-brown crystals, m.  $280^\circ$  ( $\text{MeOH-CHCl}_3$ ), 0.94 g. (crude) cis-V ( $\text{R} = \text{OH}$ ) (VIA), red-brown crystals, m.  $280^\circ$  (decomposition), 0.35 g. (crude) III ( $\text{R} = \text{NH}_2$ ) (VII), red rodlets, m.  $370^\circ$  (decomposition) ( $\text{MeOH-CHCl}_3$ ), 0.90 g. (crude) trans-VIII ( $\text{R} = \text{O}$ ) (IX) rodlets with a green-black luster, m.  $300^\circ$  (decomposition), 1.30 g. (crude) cis-VIII ( $\text{R} = \text{O}$ ), (IXA), green-black glistening rodlets, m.  $350^\circ$  (decomposition), 0.26 g. trans-X (XI), green-black glistening crystals, m.  $350^\circ$  (decomposition) ( $\text{MeOH-CHCl}_3$ ), 0.38 g. (crude) cis-X, green-black needles, m.  $350^\circ$  (decomposition) ( $\text{MeOH-CHCl}_3$ ), 0.35 g. (crude) cis-VIII ( $\text{R} = \text{NH}$ ) (XII), and 0.25 g. (crude) trans-VIII ( $\text{R} = \text{NH}$ ) (XIIA). IV (50 mg.) in 5 cc. dry  $\text{C}_5\text{H}_5\text{N}$  treated at room temperature with 5 cc.  $\text{Ac}_2\text{O}$ , evaporated after 24 hrs., and the residue chromatographed on silica gel yielded 26 mg. red triacetate B of IV, m.  $222-5^\circ$  (decomposition) ( $\text{C}_6\text{H}_6\text{-cyclohexane}$ ), and 7 mg. triacetate A of IV, yellow needles, m.  $234-7^\circ$  (decomposition). VI (100 mg.) gave similarly 15.9 mg. orange triacetate of VI, m.  $240^\circ$  (decomposition) ( $\text{C}_6\text{H}_6\text{-cyclohexane}$ ). VI (52 mg.) in 20 cc.  $\text{EtOH}$  warmed 5 hrs. on the water bath with 250 mg.  $\text{O-C}_6\text{H}_4(\text{NH}_2)_2$  (XIII) in 10 cc.  $\text{AcOH}$  and evaporated, and the residue evaporated with  $\text{C}_5\text{H}_5\text{N}$  and chromatographed on silica gel yielded 20 mg. phenazine derivative of VI, orange crystals, m.  $231-3^\circ$  (decomposition) ( $\text{C}_6\text{H}_6\text{-cyclohexane}$ ). VIA (43 mg.) treated 24 hrs. with  $\text{Ac}_2\text{O-C}_5\text{H}_5\text{N}$  at room temperature and evaporated, and the residue chromatographed on  $\text{CaSO}_4$  yielded 21 mg. triacetate of VIA, orange-yellow crystals, m.  $239-42^\circ$  (decomposition). VIA (77 mg.) and XIII yielded 16.5 mg. yellow phenazine derivative, m.  $213-17^\circ$  (decomposition) ( $\text{C}_6\text{H}_6\text{-cyclohexane}$ ). VII (120 mg.),  $\text{Ac}_2\text{O}$ , and  $\text{NaOAc}$  refluxed 20 min., and the crude product chromatographed successively on silica gel and  $\text{CaSO}_4$  yielded 10.5 mg. red triacetate of VII, m.  $160-3^\circ$  (decomposition). IX (139 mg.) acetylated and chromatographed on silica gel gave 34 mg. N-Ac tetraacetate derivative of IX, red rodlets, m.  $165-70^\circ$  (decomposition). IXA (96 mg.) acetylated with  $\text{Ac}_2\text{O-NaOAc}$  and chromatographed on  $\text{CaSO}_4$  yielded 21 mg. N-Ac tetraacetate derivative of IXA, orange-red crystals, m.  $172-5^\circ$  (decomposition). XI (30 mg.) with  $\text{C}_5\text{H}_5\text{N-Ac}_2\text{O}$  yielded during 3 days at room temperature 13 mg. N-Ac triacetate derivative of XI, orange crystals, m.  $164-7^\circ$  (decomposition) ( $\text{C}_6\text{H}_6\text{-cyclohexane}$ ), cis-X (55 mg.) yielded similarly 13.9 mg. N-Ac triacetate derivative of cis-X, red-orange crystals, m.  $172-5^\circ$  (decomposition) ( $\text{C}_6\text{H}_6\text{-cyclohexane}$ ). Crude XII (160 mg.) or 120 mg. XIIA were reprecipitated from a few cc.  $\text{MeOH}$  with  $\text{C}_6\text{H}_6$  and filtered, and the blue amorphous residues, which did not melt up to  $340^\circ$  but decomposed with effervescence when inserted at  $240^\circ$ , were isolated as XII.1/2 $\text{H}_2\text{SO}_4$  and XIIA.1/2 $\text{H}_2\text{SO}_4\text{.MeOH}$ , resp. Pure VI or VIA (1 mg.), each in 1 cc. glycerol heated in vacuo in a sealed tube at  $185^\circ$  and partitioned after 1 hr. between  $\text{BuOH-H}_2\text{O}$ , and the residues from the red  $\text{BuOH}$  phases chromatographed on cellulose powder showed that both dyes were isomerized to about 50%. IX and IXA heated to  $200^\circ$  during 1 hr. turned red-brown; in glycerol during 1.5 hrs. at  $200^\circ$  only brown-black decomposition products were formed. I (10 g.) and 8.6 g.  $\text{KOH}$  in 200 cc.  $\text{H}_2\text{O}$  kept 5 days at room temperature in the air, acidified with dilute  $\text{H}_2\text{SO}_4$ , and extracted with  $\text{BuOH}$  yielded 8.6 g. dark brown mass which dissolved in 100 cc. upper phase of  $\text{BuOH-0.2M}$  phosphate buffer (pH 7) and

chromatographed on cellulose powder yielded 2.2 g. 6-hydroxy-2,5-dimethyl-3-(4,6-dihydroxy-2,5-dimethylphenyl)-1,4-benzoquinone (XIV), red rodlets, m. 223-4° (MeOH CHCl<sub>3</sub>), 60 mg. 2,5-dimethyl-4,6-bis(4-hydroxy-3,6-dioxo-2,5-dimethyl-1,4-cyclohexadienyl)resorcinol (XV), orange rodlets, m. 282-3° (MeOH), pK 6.80, and 752 mg. 4,4'-dihydroxy-3,6,3'6'-tetramethylbiphenyl-2,5,2',5'-diquinone (XVI), orange-yellow rhombs, m. 208-10° (MeOH and sublimed in vacuo at 170°). XIV (195 mg.) in 5 cc. C<sub>5</sub>H<sub>5</sub>N and 5 cc. Ac<sub>2</sub>O evaporated after 0.5 hr. and chromatographed on silica gel yielded 197 mg. triacetate of XIV, yellow crystals, m. 156-7° (C<sub>6</sub>H<sub>6</sub>-cyclohexane). XIV (245 mg.), 5 cc. Ac<sub>2</sub>O, and a little NaOAc refluxed 5 min. while being treated with Zn dust in small portions and evaporated yielded 380 mg. 3,4,6,4',6'-pentaacetoxy-2,5,2',5'-tetramethylbiphenyl, m. 182-3° (C<sub>6</sub>H<sub>6</sub>-cyclohexane). XIV (175 mg.) and 200 mg. XIII in 4 cc. AcOH heated 0.5 hr. on the water bath and evaporated, and the residue chromatographed on silica gel yielded 150 mg. phenazine derivative (XVII), yellow-green crystals, m. 259-60° (EtOH-C<sub>6</sub>H<sub>6</sub>). XVII (120 mg.) acetylated with 5 cc. C<sub>5</sub>H<sub>5</sub>N and 5 cc. Ac<sub>2</sub>O, and the product chromatographed on silica gel yielded 118 mg. triacetate of XVII, yellow-brown crystals, m. 200-2° (EtOH). XV (14.4 mg.) in 5 cc. Ac<sub>2</sub>O refluxed 5 min. with a small amount NaOAc while being treated with Zn dust in small portions, and the product chromatographed on silica gel gave 13.2 mg. 3,5-diacetoxy-2,6-bis(3,4,6-triacetoxy-2,5-dimethylphenyl)-p-xylene, m. 204-5° (C<sub>6</sub>H<sub>6</sub>-cyclohexane). XVI (113 mg.) yielded similarly 109 mg. yellow diacetate of XVI, m. 142-3° (C<sub>6</sub>H<sub>6</sub>-cyclohexane). XVI (86 mg.) acetylated reductively yielded 126 mg. [2,5,3,4,6-Me<sub>2</sub>(AcO)3C<sub>6</sub>]2, m. 188-90° (C<sub>6</sub>H<sub>6</sub>-cyclohexane). XVI (47 mg.) and 150 mg. XIII in 5 cc. AcOH heated 0.5 hr. on the water bath, and the product chromatographed on silica gel yielded 20 mg. phenazine derivative (XVIII), black-blue needles, m. 229-31° (EtOH). XVIII (200 mg.) in 3 cc. C<sub>5</sub>H<sub>5</sub>N treated with 5 cc. Ac<sub>2</sub>O and evaporated immediately in vacuo and the residue chromatographed on silica gel yielded 94 mg. 3,3'-diacetoxy-1,4,1',4'-tetramethyl-2,2'-biphenazine, pale yellow, m. 299-300° (C<sub>6</sub>H<sub>6</sub>-cyclohexane). The infrared absorption maximum of the various compds. described and the ultraviolet absorption maximum of the various quinone are tabulated.

AB The striking difference in the absorption spectra and pK values between resorcinol blue and orcein dyes is explained by steric resonance hindrance and H bonds and confirmed on colorless tetrahydroxybiphenyl derivs. The pK values are given for the following compds.: I (R = OH, R' = H) 6.40; I (R = OH, R' = Me) 6.76; II (R = OH, R' = H) 5.31; II (R = OH, R' = Me) 4.64; III (R = OH, R' = H, R'' = Me) 7.15; III (R = OH, R' = Me, R'' = H) 7.35; IV (R = OH) 7.46. The ultraviolet absorption spectra of [2,4-(HO)2C6H3]2, [4,2,6-Me(HO)2C6H2]2, 2,4-(HO)2C6H3Me, 1,4,3,5-Me2(HO)2C6H2, 1,2,3,5-Me2(HO)2C6H2, and [2,4,6-Me(HO)2C6H2]2 are recorded.

AB cf. CA 54, 22821g. The biosynthesis of alternariol (I), C<sub>14</sub>H<sub>10</sub>O<sub>5</sub>, from *Alternaria tenuis* has been studied. Chemical degradation of labeled I derived from AcONa-1-C<sub>14</sub> (CA 48, 799i) demonstrated a biosynthetic mechanism involving head-to-tail condensation of Aco units. I was methylated to the tri-Me ether with Me<sub>2</sub>SO<sub>4</sub> and K<sub>3</sub>CO<sub>2</sub> in anhydrous acetone by refluxing the mixture. Kuhn-Roth oxidation of the trimethyl ether derivative yielded Aco- quant. Hydrolysis of I tri-Me ether by refluxing with N NaOH followed by the addition of Me<sub>2</sub>SO<sub>4</sub> and boiling for 1 min. yielded the Me ester of 2,3',4,5'-tetramethoxy-6-methylbiphenyl-2'-carboxylic acid, m. 124°. Demethylation yielded 2,3', 4', 5'-tetrahydroxy-6-methylbiphenyl, (II), m. 246-8°. Nitration of II after treatment at 100° in concentrated H<sub>2</sub>SO<sub>4</sub> for 30 min. was accomplished in an ice bath with concentrated HNO<sub>3</sub> subsequently raised to 70° to yield 2,3',4,5'-tetrahydroxy-6-methyl-3,4', 5,6'-tetranitrobiphenyl-2'-sulfonic acid, (III), m. 246°. III was degraded with hypobromite in saturated Ba(OH)<sub>2</sub>. The tri-Me ether of I was oxidized with KMnO<sub>4</sub> in N NaOH to yield 3,5-dimethoxyphthalic acid, m. 153-6°, and 4,6-dimethoxyphthalonic acid, m. 173° (decompose). The dehydration of 3,5-dimethoxyphthalic acid yielded the anhydride, m. 148-9°. Reductive decarboxylation of 4,6-dimethoxyphthalonic acid with red P and HI yielded CO<sub>2</sub> and 3,5-dihydroxyphenylacetic acid, m. 130°, which was decarboxylated by heating the solid in a stream of N gas at 270° to yield orcinol, m. 107-8°, which sublimed. Orsellinic-carboxy-C<sub>14</sub> acid was prepared from orsellin aldehyde-formyl-C<sub>14</sub> (Adams and Levine, CA 17, 3867; Hoesch, CA 7, 2396). The possibility that orsellinic acid is a common precursor with other fungal phenols containing C<sub>14</sub> skeletons is discussed.

L18 ANSWER 74 OF 87 CAPLUS COPYRIGHT 2008 ACS on STN

AB cf. CA 54, 15322c. o,o'-Dihydroxybiphenyls showed an extraordinarily high acidity in the 1st dissociation step and a large difference in the 2nd step if a stable H bridge could form in the monoanion. If the H bridge was hindered by substituents in the 6,6'-position, the OH groups dissociated practically independently from each other. The dissociation of hydroxybiphenylquinones was investigated spectroscopically and by potentiometric titration. (o-HOC6H4)2 (18.6 g.) in 100 cc. Me2CO and 7.9 g. K2CO3 treated at reflux with stirring with 5.05 g. Me2SO4 in 20 cc. Me2CO during 40 min., the mixture refluxed 1 hr., evaporated, the residue

diluted with 100 cc. H2O, acidified, extracted with Et2O, the extract washed with N Na2CO3 and N NaOH, and evaporated yielded 7.62 g. o-MeOC6H4C6H4OH-o (I), m. 73-4° (50% AcOH). I (0.83 g.) in 10 cc. C5H5N-Ac2O kept 3 hrs. at room temperature gave 100% viscous oily acetate of I, b0.05 85-90°, n20D 1.5778. Phoenicin (II) (268 mg.) in 50 cc. dry CHCl3 refluxed 7 min. with 250 mg. Ag2O and 5 cc. MeI, treated again with the same amts. of Ag2O and MeI, concentrated to half-volume after 12 min., filtered, washed with CHCl3, evaporated in vacuo, and the residue chromatographed on cellulose powder yielded 70 mg. unchanged II, 101 mg. mono-Me ether (III) of II.MeOH, m. 70° resolidified and rem. 139-44° (decomposition) [the melt solidified to long needles of III, m. 230-2° (decomposition)], and 79 mg. di-Me ether of III, m. 130-1° (C6H6-cyclohexane and sublimed at 110° in vacuo), followed by 61 mg. red-brown lacquer. III (30.1 mg.) heated on the microscope stage 2 hrs. at 140-5° and sublimed in vacuo gave 19.4 mg. 2,7-dimethyldibenzofuran[1,4;5,8]diquinone (anhydrophoenicin). The pK values in 50% MeOH and in H2O were determined titrimetrically and spectroscopically in both cases: PhOH, 10.78, 10.74, 9.98, 9.99; m-MeC6H4OH, -, -, -, 10.11; 2-C10H7OH, 10.56, 10.64, 9.97, -, 3,5-(HO)2C6H3Me, 10.50, 10.66, 9.38, 9.48 (pK1) [11.96, -, 11.20, - (pK2)]; o-HOC6H4Ph, 11.22, 11.24, -, 10.01; I, 11.32, 11.42, -, 10.40; (o-HOC6H4)2, 8.00, 7.94, 7.56, 7.46 (pK1) [12.20, above 13.00, 11.80, above 13.00 (pK2)]; 3,2-(o-HOC6H4)C10H6OH, 7.94, 8.00, -, 7.55 (pK1) [11.98, above 13.00, -, above 13.00 (pK2)]; (m-HO-C6H4)2, 10.26, -, -, - (pK1) [10.90, 11.02, -, 9.86 (pK1.2)] 11.44, -, -, - (pK2); (p-HOC6H4)2, 10.40, -, -, - (pK1) [11.10, -, -, 9.62 (pK1.2)] 11.70, -, -, - (pK2)]; [2,4-Me(HO)C6H3]2, 10.70, -, -, - (pK1) [11.24, -, -, 10.11 (pK1.2)]; 11.70, -, -, - (pK2)]; [6,2-Me(HO)C6H3]2, 11.22, -, -, - (pK1) [11.80, 11.72, -, 10.45 (pK1.2); 12.14, -, -, -, (pK2)]; (2-HOC10H6)2, 10.64, -, -, - (pK1) [11.10, -, -, -, - (pK1.2)]; 11.68, -, -, - (pK2)]; [2,4-(HO)2C6H3]2 (IV), 7.88, -, 7.44, - (pK1) [10.75, -, 10.10, - (pK2)]; [4,2,6-Me(HO)2C6H2]2 (V), 9.04, -, 8.54, - (pK1) [9.36, -, 8.80, 8.94 (pK1.2); 9.72, -, 9.30, - (pK2); 12.03, -, 11.32, - (pK3); 12.16, -, 11.70, - (pK3.4)]; [6,2,4-Me(HO)2C6H2]2 (VI), 10.20, -, 9.34, - (pK1) [10.68, -, 9.90, 9.86 (pK1.2); 11.15, -, 10.45, - (pK2); 11.92, -, 11.45,

- L18 ANSWER 75 OF 87 CAPLUS COPYRIGHT 2008 ACS on STN  
AB cf. C.A. 52, 10091b; Henrich, C.A. 33, 1657. Henrich's formula suggesting that the quinone obtained by autoxidation of orcinol in aqueous KOH is 3,6,6'-trihydroxy-2,2'-dimethyldiphenoxiquinone is improbable due to steric hindrance. The monoquinone 6-hydroxy-3-(4,6-dihydroxy-2-tolyl)toluquinone (I) has been prepared by synthesis. Successive methylation of 2-nitro-3,5-dihydroxytoluene with 3 equivalents. Me2SO4 in 10% aqueous NaOH gives 2-nitro-3,5-dimethoxytoluene, m. 106°. A solution containing 1.28 g. product in 20 cc. MeOH is diluted with 45 cc. hot dilute H2SO4 and treated with Zn dust until colorless when boiled. MeOH is evaporated, dilute NaOH added, and the mixture extracted with Et2O to give 2-amino-3,5-dimethoxytoluene (II), b0.04 70°, which discolors in air. A solution of 37 mg. II in 1 cc. pyridine and 1 cc. Ac2O is left 24 hrs. and then evaporated in vacuo at 20° to yield 30.2 mg. 2-acetamido-3,5-dimethoxytoluene, m.

152°. Diazotization of 0.5 g. II in 5 cc. dilute H<sub>2</sub>SO<sub>4</sub> by dropwise addition of 0.21 g. NaNO<sub>2</sub> in 1 cc. H<sub>2</sub>O at 0° gives the diazonium salt solution (III); after 15 min. 0.55 g. KI in 1 cc. H<sub>2</sub>O is then added, the mixture warmed 2 hrs. at 80° until N evolution is complete, and extracted with C<sub>6</sub>H<sub>6</sub>. Impurities are removed from the washed, dried solution by adsorption on Al<sub>2</sub>O<sub>3</sub>; evaporation yields 72% 2-iodo-3,5-dimethoxytoluene (IV), m. 84-6°. Monoiodo-*o*-cresol on methylation with Me<sub>2</sub>SO<sub>4</sub> in aqueous NaOH at 100° and on extraction with Et<sub>2</sub>O and distillation gives *o*-cresol di-Me ether, bl 80°, and a mixture, bl 160°, separated at 10-3 mm. into IV, b. 70-80°, as well as diiodo-3,5-dimethoxytoluene (V), subliming and m. 202-3°. Direct iodination of 3.08 g. 2,4-dimethoxytoluene with 5.30 g. iodine and 4.70 g. PbO, started by adding 0.05 g. HgO and refluxing 48 hrs., is followed by chromatography of the C<sub>6</sub>H<sub>6</sub> solution on Al<sub>2</sub>O<sub>3</sub> to remove impurities and gives 2.4% V, 38% IV, and a mixture containing mono- and diiodo isomers. Deiodination of 2.52 g. IV with 7 g. electrolytic Cu in the absence of air at 100° and then for 5 hrs. at 200° is followed by extraction with C<sub>6</sub>H<sub>6</sub> and chromatography giving 90% 4,4',6,6'-tetramethoxy-2,2'-bitolyl, m. 103-4°. This product (1.87 g.) is warmed with pyridinium chloride to 150°, then at 180° for 1 hr., and finally at 200° for 0.25 hr. Extraction by Et<sub>2</sub>O, alkaline extraction of the solution under N, acidification, and extraction by Et<sub>2</sub>O

gives 4,4',6,6'-tetrahydroxy-2,2'-bitolyl (VI), m. 237-9°, yellowing in aqueous solution and turning brown in alkali. Treatment of the tetra-Me ether with HI gives 43% VI and 45% 2,7-dihydroxy-4,5-dimethyldibenzofuran, m. 247-8°. VI with Ac<sub>2</sub>O gives the tetraacetate, m. 136-7°. Oxidation of a solution of 0.5 g. VI and 1 g. K<sub>2</sub>HPO<sub>4</sub> in 15 cc. H<sub>2</sub>O by dropwise addition of 2 moles K nitrosodisulfonate at 0°, acidification, crystallization from the filtrate, and recrystn. from AcOH, H<sub>2</sub>O-EtOH, or CHCl<sub>3</sub>-EtOH gives I, m. 131-2° (decomposition), purified by distribution chromatography. On treatment with Zn dust and Ac<sub>2</sub>O, I gives 3,4,4',6,6'-pentaacetoxy-2,2'-bitolyl (VII), m. 154°, also obtained by hydrogenation of the solution in Ac<sub>2</sub>O with 1.1 moles H over Pd-BaSO<sub>4</sub>, when some leucohexaacetate, m. 194-201°, is also formed. Oxidation of 0.5 g. VI with 4 moles K nitrosodisulfonate at 0° yields 4,4'-dihydroxy-2,2'-bitolyldiquinone (VIII), m. 207° (discoloring from 180°), which on treatment with Zn and Ac<sub>2</sub>O gives 3,3',4,4',6,6'-hexaacetoxy-2,2'-bitolyl (IX), m. 199-201°. Genuine Henrich's quinone is prepared, m. 155-9° (decomposition), together with some diquinone, m. 175-80° (decomposition). Reductive acetylation gives VII and IX and distribution chromatography of Henrich's quinone with BuOH-0.2M phosphate buffer at pH 7.10 on 3 cellulose columns gives I and VIII, identified by m.p. Treatment of I with *o*-phenylenediamine gives 3-hydroxy-1-methyl-2-(4,6-dihydroxy-2-tolyl)phenazine, m. 298-300° (acetate, m. 160° and 168°), and treatment of VIII with *o*-phenylenediamine gives 3,3'-dihydroxy-1,1'-dimethyl-2,2'-biphenazine, m. 220-30° (diacetate, m. 221°). Oxidation of *o*-cresol hydrate with K nitrosodisulfonate gives 6-hydroxytoluquinone, m. 117-27°, yielding 3-hydroxy-1-methylphenazine, decompose 290° (acetate, m. 149°). Resolution of a solution of I buffered to pH 9.0 by fractional chromatography on a column of starch grains of 0.05-0.075 mm. for 3 days gives [α]<sub>D</sub><sup>20</sup> 153-4° or -153-4° for the isomer.

GI For diagram(s), see printed CA Issue.

AB A structure for picrolichenic acid (I), C<sub>25</sub>H<sub>30</sub>O<sub>7</sub>, is proposed (cf. Zopf, Ann. 321, 32(1902)). I is optically inactive and contains OH, OMe, CO, CO<sub>2</sub>H, lactone, and two C-Me groups. With CH<sub>2</sub>N<sub>2</sub> it gives a mono-Me ester, m. 102-3.5°, and a neutral O,O-di-Me derivative, m. 80-2°. I with KMnO<sub>4</sub> gives caproic acid. In NaOH acidified in the cold it gives a gum which loses CO<sub>2</sub> to form a monocarboxylic acid, C<sub>24</sub>H<sub>32</sub>O<sub>6</sub> (II), m. 145-8° (decomposition). II on boiling with HBr undergoes

decarboxylation and demethylation to diolevitol (III), m. 180-1°. Dehydration of III with  $\text{ZnCl}_2$  gives a highly fluorescent phenol, C22H28O3; the di-Me ether, m. 71.5-3°, of the latter is oxidized with permanganate to a dicarboxylic acid, the di-Me ester of which, m. 191-3.5°, is identical with 3,7-dimethoxy-1,9-dicarbomethoxydibenzofuran (cf. Shibata, C.A. 45, 7100d). I is the first example of a lichen acid formed by intramol. C-C coupling (cf. Festschr. Arthur Stoll, Basel, 1957, p. 144; Barton and Cohen, *ibid.*, p. 117).

GI For diagram(s), see printed CA Issue.  
AB cf. C.A. 38, 12186. [The nomenclature and numbering of the biquinones OC.CH:CR.CO.CR':CC:CR'.CO.CR:CH.CO (A) and the (dihydroxy- or alkoxyphenyl)-p-benzoquinones OC.CH:CR.CO.CR':CC:CH.C(OR'):CR.CH:COR' (B) or their tautomeric forms OC.CH:CR.C(OR'):CR':C.C:CH.C(OR'):CR.CH.CO(B') in the original of this paper differ from C.A. usage. In this abstract the compds. are designated by A, B, or B', followed in parentheses by R, R', and R'' in that order.] A mixture of 23 g. powdered A (Me, H, H) (I) and 92 g. p-C6H4(OH)2 added to 2.3 l. boiling water, boiled 1-2 min. and the air-dried product washed with boiling water yielded 20 g. B (or B') (Me, H, H) (II), m. 256-8° (corrected).  $\text{AlCl}_3$  (2.5 g.) added to 500 mg. toluquinone in 6 cc.  $\text{CS}_2$ , the mixture shaken 30 min. at room temperature, and the air-dried product added portionwise to 50 cc. 2N HCl at 0° yielded 230 mg. II, m. 256-8°. II in EtOH oxidized with  $\text{FeCl}_3$  yielded I. Powdered anhydrous  $\text{AlCl}_3$  (15 g.) added to 3 g. phenyl-p-benzoquinone in 60 cc.  $\text{CS}_2$ , the mixture shaken 5 hrs., the air-dried product decomposed with 10% HCl at 0°, washed with boiling EtOH, and the residue recrystd. from  $\text{PhNO}_2$  yielded 1.5 g. B (or B') (Ph, H, H) (III), m. 312-15° (corrected). Powdered III (400 mg.) in 10 cc. AcOH treated with 1 cc. 6N  $\text{CrO}_3$  in AcOH, and

the mixture shaken 1 hr., allowed to stand overnight, and poured into 10 cc. water yielded 370 mg. A (Ph, H, H), m. 304-9° (corrected). Powdered II (18 g.) added in 3- to 5-g. portions to 95 cc. Ac2O and 5 cc. H2SO2 at 0°, and the mixture allowed to stand 3 hrs. at room temperature and poured into 10-15 parts ice water yielded 28 g. 2,3,3',6,6'-pentaacetoxy-4,4'-ditolyl (IV), m. 165-6°. IV (19 g.) refluxed 20 min. in 160 cc. N HCl under H and the product concentrated to 50 cc. and dried over KOH yielded 10.5 g. pentahydroxy analog (V) of IV, m. 220-5°. V (10 g.) in 100 cc. hot EtOH cooled, diluted with 200 cc. water, and the filtered solution added portionwise to 50 cc. 3.3N FeCl3 yielded 9 g. A (Me, H, HO) (VI), m. 178-80°; acetate, m. 152-3°; Me ether, m. 102-3°.

VI (1 g.) treated at 0° with 6 cc. 5% H2SO4 in Ac2O, the mixture allowed to stand 24 hrs. at room temperature, poured into 10 parts ice water, the air-dried product refrigerated 24 hrs. in 2-3 parts absolute EtOH, and the insol. residue (1.3 g.) dissolved in 25 parts boiling EtOH and slowly cooled yielded 90-130 mg. rearrangement product (VII), m. 213-15°, of VI; the alc. mother liquors from VII diluted with water and the product recrystd. from AcOH yielded 400-500 mg. 1,3,4,5,6(or 8)-pentaacetoxy-2,7-dimethyldibenzofuran (VIII), m. 165°; the first two AcOH mother liquors from VIII poured into cold water yielded 170-250 mg. 2,2',3',6'-tetraacetoxy-4,4'-ditolyl-3,6-quinone (IX), m. 156°. IX (140 mg.) in 1.4 cc. Ac2O treated with 300 mg. powdered Zn and 0.3 cc. pyridine, the mixture heated to boiling until decolorized, filtered, and the filtrate poured into water yielded 150 mg. 2,2',3,3',6,6'-hexaacetoxy-4,4'-ditolyl (X), m. 202-3°. VIII (270 mg.) refluxed 30 min. with 4 cc. N HCl-MeOH, the product dried over KOH, the residue (150 mg. m. 220-5°) dissolved in 2.5 cc. hot EtOH, and the solution cooled and treated first with 2.5 cc. water, then with 0.9 cc. 2.5N FeCl3, yielded 110 mg. 3-hydroxy-2,7-dimethyldibenzofurandiquinone (XI), m. 252-4° (corrected). Powdered XI (50 mg.) dissolved in 1.5 cc. 5% H2SO4 in Ac2O, and the mixture allowed to stand 48 hrs. at room temperature and poured into ice water yielded 3,5,6,8-tetraacetoxy-2,7-dimethyldibenzofuran-1,4-quinone (XII), m. 225-35° (decomposition). XII (300 mg.) in 0.5 cc. Ac2O containing 30 mg. anhydrous NaOAc treated with 70 mg. powdered Zn, the solution filtered hot, and the combined filtrates added to cold water yielded 1,3,4,5,6,8-hexaacetoxy-2,7-dimethyldibenzofuran (XIII) (hexaacetate of anhydrodihydroxyleucopenicidin), m. 255-6°. VI (50 mg.) in 0.5 cc. absolute EtOH refluxed 1 hr. with 0.2 cc. cyclopentadiene and the solution evaporated yielded dicyclopentadiene-2-hydroxy-4,4'-ditoluquinone (XIV), m. 154°. B (or B') (MeO, H, H), m. 269° (corrected) (10 g.), added to 60 cc. 5% H2SO2 in Ac2O at 0° and the mixture allowed to stand 3 hrs. at room temperature yielded 200 mg. 4,4'-dimethoxydiquinone, m. 271-2° (corrected). The filtrate poured into 600 cc. ice water yielded a small amount of 3,3',6,6'-tetraacetoxy- but mostly (7.1 g.) 2,3,3',6,6'-pentaacetoxy-4,4'-dimethoxydiphenyl (XV), m. 196-7°. XV (1.08 g.) in 9 cc. N HCl-MeOH refluxed 40 min. under CO2 and the product distilled and finally dried over KOH yielded 630 mg. pentahydroxy analog (XVI) of XV, m. 194-7°. XVI with 5% H2SO4 in Ac2O yielded XV, m. 196-7°.

L18 ANSWER 81 OF 87 CAPLUS COPYRIGHT 2008 ACS on STN  
 AB cf. C.A. 49, 13283d. With HCl 2-methoxy-6-propyl-1,4-benzoquinone (I) formed 5,5'-dimethoxy-3,3'-dipropyl-2,2'-bi-p-benzoquinone (II) and 2,8-dihydroxy-3,7-dimethoxy-1,9-dipropyldibenzofuran (III) in addition to the expected 2,3,5,1,4-ClPr(MeO)C6H(OH)2. The relation between this reaction and the self-condensation of methoxy-1,4-benzoquinone (IIa) is discussed. From results obtained by varying the reaction conditions and by condensing representative quinones with appropriate phenols, a mechanism for the self-condensation was deduced, but the naturally occurring biquinones phenocin (3,3'-dihydroxy-5,5'-dimethyl-2,2'-bi-p-benzoquinone) (IV) and oosporein (the 6,6'-di-HO derivative of IV) (V) are probably not formed by an analogous process. 2,4-MeO(O2N)C6H3OH (9.5 g), 10 g. K2CO3, and 6 g. CH2:CHCH2Br boiled in 100 mL. Me2CO, a solution of the product in Et2O washed with dilute aqueous NaOH, dried and evaporated yielded an oil which, crystallized from petr. ether (b. 40-60°) (hereafter referred to as petr. ether A),

gave 8 g. O-allyl-4-nitroguaiacol (VI), pale yellow prisms, m. 53°; VI (5 g.) rearranged in boiling quinoline (VII) during 30 min., the mixture diluted with Et<sub>2</sub>O, freed from VII by 10% H<sub>2</sub>SO<sub>4</sub>, the phenolic product extracted with 10% aqueous NaOH, and acidified with dilute HCl yielded 6-allyl-4-nitroguaiacol (VIII), yellowish prisms, m. 72° (from petr. ether A), which (4 g.) in 100 mL. MeOH treated 0.5 h. with H and 2% Pd-C, the product isolated and mixed with a solution of 50 g. Fe<sub>2</sub>(SO<sub>4</sub>)<sub>3</sub> in 500 mL. H<sub>2</sub>O, the product steam distilled, the distillate extracted with Et<sub>2</sub>O, the extract evaporated, and the product crystallized gave 0.3 g.

2-methoxy-6-propyl-1,4-benzoquinone (IX), yellow prisms, m. 78-9° (from petr. ether A),  $\lambda_{\text{maximum}}$  266 m $\mu$  (log  $\epsilon$  4.25), readily soluble in common organic solvents, and gave a red color with aqueous NaOH or concentrated H<sub>2</sub>SO<sub>4</sub> [method (1)].

Method (2): 6 g. 6-allylguaiacol in 100 mL. MeOH shaken with H and 2% Pd-C yielded after distillation 5 g. 6-propylguaiacol (X), b<sub>20</sub> 142°; 2.2 g. NaNO<sub>2</sub> in 6 mL. H<sub>2</sub>O added to a solution of 6.3 g. 4-H<sub>2</sub>N<sub>2</sub>C<sub>6</sub>H<sub>4</sub>SO<sub>3</sub>H and 1.6 g. anhydrous Na<sub>2</sub>CO<sub>3</sub> in 30 mL. H<sub>2</sub>O, the mixture poured on 3.5 g. ice and 6.5 mL. concentrated HCl, 15 min. later 5 g. X in 30 mL. 20% NaOH added, the resulting dye kept overnight and reduced at 80° with 10 g. SnCl<sub>2</sub> and 22 mL. concentrated HCl, the crude aminoguaiacol oxidized with 80 g. Fe<sub>2</sub>(SO<sub>4</sub>)<sub>3</sub> in 500 mL. H<sub>2</sub>O, and the product isolated by steam distillation gave a poor yield of

IX.

Method (3): 7 g. K<sub>2</sub>S<sub>2</sub>O<sub>8</sub> in 250 mL. H<sub>2</sub>O added during 2 h. to a stirred solution of 5 g. X in 10% aqueous NaOH at 10°, the mixture kept 12 h., acidified to Congo red, filtered through cotton wool to remove tar, acidified to litmus, kept 1 h. at 100°, and extracted with Et<sub>2</sub>O, the extract evaporated, and the residue crystallized gave 1.5 g. 2-methoxy-6-propylhydroquinone (XI), m. 106° (from petr. ether (b. 80-100°) (hereafter called petr. ether C); oxidation of 6 g. XI in 30 mL. 10% AcOH with 100 mL. 2% aqueous CrO<sub>3</sub> at 0° during 0.5 h. gave an almost quant. yield of IX. 5,2-Cl(MeO)C<sub>6</sub>H<sub>3</sub>OH (6 g.), 6 g. K<sub>2</sub>CO<sub>3</sub>, and 5.5 g. CH<sub>2</sub>:CHCH<sub>2</sub>Br in 100 mL. Me<sub>2</sub>CO refluxed 4 h. on a steam bath, isolated in the usual way, and distilling gave 5 g. O-allyl-5-chloroguaiacol (XII), b<sub>20</sub> 142°. XII (4.5 g.) completely isomerized on boiling 1 h. with 4 g. Me<sub>2</sub>NPh, the reaction mixture diluted with Et<sub>2</sub>O, washed with dilute H<sub>2</sub>SO<sub>4</sub>, dried, and evaporated left 3.7 g. 6-allyl-5-chloroguaiacol (XIII), b<sub>20</sub> 150° [benzoate, plates, m. 78° (from MeOH)]. XIII (8 g.) in 30 mL. MeOH containing 2 g. 5% Pd-C absorbed 1 mol H in about 10 min., the filtered solution evaporated, and the residue distilled furnished 7.5 g.

5-chloro-6-propylguaiacol (XIV), b<sub>20</sub> 156° [benzoate, m. 100° (from dilute EtOH)]. XIV (4 g.) treated by method 2 above gave 2 g. 2-chloro-5-methoxy-3-propyl-1,4-benzoquinone (XV), greenish yellow prisms, m. 92° (from petr. ether A), which readily sublimed and formed a pink solution in alkali and a red one in concentrated H<sub>2</sub>SO<sub>4</sub>. XV (1 g.) suspended in 50 mL. H<sub>2</sub>O and treated with SO<sub>2</sub> until no further change, the precipitate filtered off, dried, and crystallized gave 0.8 g. of the corresponding hydroquinone (XVa), colorless prisms, m. 103-4°, which with CrO<sub>3</sub> in AcOH regenerated XV. The blue coupled product from 10 g. IIIa refluxed about 20 min. with 2 g. Zn dust in 200 mL. 55% AcOH, 5 mL. 2N HCl added, the hot solution filtered, and cooled deposited 7.2 g. [4,2,5-MeO(HO)2C<sub>6</sub>H<sub>2</sub>]<sub>2</sub> (XVI), fawn prisms, m. 210° (decomposition). XVI (4 g.) sifted into 25 mL. sirupy H<sub>3</sub>PO<sub>4</sub> at 180°, the solution cooled, diluted with an equal volume H<sub>2</sub>O, the mixture filtered, the solid washed, and crystallized gave 2,8-dihydroxy-3,7-dimethoxydibenzofuran

(XVII), colorless plates, m. 188° (from EtOH or C6H6-petr. ether b. 60-80°) (hereafter referred to as petr. ether B),  $\lambda_{\text{maximum}}$  316 m $\mu$  (log  $\epsilon$  4.4), which produced an intense blue concentrated H2SO4 reaction [diacetate, m. 200° (from dilute EtOH)]. XVII (2 g.), 2 g. K2CO3, and 1.6 mL. CH2:CHCH2Br in 200 mL. Me2CO refluxed 6 h. and recrystd. gave 1.5 g. 2,8-diallyloxy compound (XVIII), m. 112-13°, insol. in alkalis and gave a deep blue H2SO4 reaction. XVIII (5 g.), 40 mL. Et2NPh, and 5 mL. Ac2O heated (oil-bath at 180-90°) 5 h. in a N atmospheric, the mixture cooled, diluted with 200 mL. Et2O, filtered, freed from Et2NPh by HCl, and the filtrate evaporated left a yellow gum which solidified on trituration with MeOH; the solid appeared to be a complex mixture from which 2 compds. were isolated by fractional crystallization from EtOH and EtOAc alternately, the less soluble substance forming 0.5 g. prisms, m. 220° (from EtOH), while the more soluble fraction purified from EtOH gave 1.8 g. 2,8-diacetoxy-1,9-diallyl-3,7-dimethoxydibenzofuran (XIX), m. 166°, giving a blue H2SO4 reaction; hydrogenated over 0.5 g. 2% Pd-C in 200 mL. EtOH, 0.5 g. XIX absorbed 2 mol H in 5 min. and gave 0.5 g. of the diacetate of III, m. 169° (from EtOH), giving a blue H2SO4 reaction. HCl led 1 h. into 2 g. IX in 50 mL. CHCl3, the solvent removed in vacuo, the residue trituated with a little MeOH, and fractionally crystallized from MeOH gave II, which repeatedly purified from MeOH yielded 0.6 g. yellow prisms, m. 172°,  $\lambda_{\text{maximum}}$  272 m $\mu$  (log  $\epsilon$  4.3), becoming orange with H2SO4 and pink with aqueous NaOH; recrystn. of the more soluble fraction from dilute MeOH gave 0.7 g. III, plates,  $\lambda_{\text{maximum}}$  227, 312 m $\mu$  (log  $\epsilon$  4.6, 4.45), soluble in aqueous NaOH and insol. in aqueous Na2CO3, and giving a deep blue H2SO4 reaction; when the CHCl3 was replaced by Et2O in this experiment, the crude solid obtained gave 3 fractions from MeOH: (a) 0.4 g. II, (b) a middle fraction of 0.5 g. III, and (c) the most soluble fraction, which on dilution with H2O gave 0.6 g. XVA. III (0.5 g.) in 15 mL. boiling EtOH treated 30 min. with 1 g. FeCl3, the solution diluted with Et2O, washed with H2O, dried and evaporated left 0.25 g. II. II (0.5 g.) suspended in 20 mL. H2O containing 5 mL. MeOH reduced 20 min. by SO2, the precipitate filtered, washed with H2O, and crystallized gave 0.45 g. [2,4,3,6-Pr(MeO)(HO)2C6H]2, prisms, m. 190° (from dilute MeOH), easily oxidized in air and gave a red solution in aqueous NaOH and an emerald-green H2SO4 reaction [tetraacetate, m. 160° (from dilute EtOH)],  $\lambda_{\text{maximum}}$  280 m $\mu$  (log  $\epsilon$  3.6). III sublimed from an intimate mixture of 0.2 g. biquinol and 0.5 g. P2O3 at 190°/0.05 mm. was formed in the same yield when the biquinol was treated with HCl 1 h. at 0°, and identified by comparison with authentic material. Methoxy-p-benzoquinone (1 g.) in 25 mL. ice-cold CHCl3 treated 5 min. with a stream of HCl, the blue precipitate collected and identified with the product prepared according to Erdtman (C.A. 28, 1337.2), the residue left on evaporation of the CHCl3 liquor extracted with boiling petr. ether A, the exts. cooled, filtered, concentrated, chilled, and recrystd. gave a small amount of 2-chloro-5-methoxyhydroquinone, m. 128°. A slow stream of HCl led into a solution of 50 mg. IX and 50 mg. XI in 5 mL. CHCl3 for 1 h., the solution evaporated, the residue extracted with boiling petr. ether B, the exts. combined, concentrated, and cooled gave 70 mg. III, m. 152° (from MeOH). p-Benzoquinone (1.1 g.) in 30 mL. AcOH containing 0.9 g. C-methylphloracetophenone vigorously stirred 24 h., the solid isolated, air dried, and washed with cold MeOH left 0.8 g. 2,5-bis(3-acetyl-2,4,6-trihydroxy-5-methylphenyl)-1,4-benzoquinone (XX), bright yellow prisms, m. 245° (decomposition) (blackening at 190°), insol. in EtOH,

dioxane,  $\text{CHCl}_3$ , and  $\text{EtOAc}$ , decomposed in warm  $\text{AcOH}$ ; in aqueous  $\text{Na}_2\text{CO}_3$ , XX gave a green, in 2N  $\text{NaOH}$  a red, and in concentrated  $\text{H}_2\text{SO}_4$  an inky blue color. The MeOH

washings of XX concentrated gave 0.2 g. quinhydrone, green-black, m.  $171^\circ$  (decomposition). A stirred solution of 0.9 g. C-methylphloroacetophenone and

0.55 g. p-benzoquinone in 10 mL.  $\text{AcOH}$  held 1 h. at  $60^\circ$ , next day the pink solid filtered, washed with  $\text{AcOH}$  and then with  $\text{Et}_2\text{O}$ , and air dried yielded 0.85 g. 2,5-bis(3-acetyl-2,4,6-trihydroxy-5-methylphenyl)quinol, m.  $270^\circ$  (decomposition), soluble in  $\text{EtOH}$  and gave a transient green-brown reaction with  $\text{Fe}^{+++}$ , a brilliant red solution in 2N  $\text{NaOH}$ , and a rose-red reaction with  $\text{H}_2\text{SO}_4$ . A mixture of 1.3 g. anhydrous 1,3,5-(HO) $3\text{C}_6\text{H}_3$  and 1.7 g. 2,6-dimethoxy-1,4-benzoquinone moistened with  $\text{AcOH}$  and warmed 15 min. later gave a solid which separated on cooling, but the mother liquor yielded the purer product on recrystn. from  $\text{H}_2\text{O}$ , 2',3,4',6,6'-pentahydroxy-2,4-dimethoxybiphenyl, m.  $250^\circ$  (decomposition), gave a neg. reaction with  $\text{Fe}^{+++}$ , and a green, then a purple, solution with concentrated  $\text{H}_2\text{SO}_4$ .

L18 ANSWER 85 OF 87 CAPLUS COPYRIGHT 2008 ACS on STN

AB Concentration of the Et2O extract of 1500 g. of a mixture of *Cladonia* species yielded,

successively, 1.5 g. squamatic acid, 2 g. barbat(in)ic acid, and 1.7 g. didymic acid (I). I, C<sub>22</sub>H<sub>26</sub>O<sub>5</sub>, recrystd. from petr. ether, m. 172-3° (decomposition), develops colors as follows: FeCl<sub>3</sub>, blue; CaCl<sub>2</sub> on crystals moist with EtOH, blue-green; concentrated H<sub>2</sub>SO<sub>4</sub>, yellow to green on warming. It is readily soluble in aqueous NaOH, EtOH, Et<sub>2</sub>O, and Me<sub>2</sub>CO, difficultly soluble in aqueous Na<sub>2</sub>CO<sub>3</sub> or NaHCO<sub>3</sub>, AcOH, C<sub>6</sub>H<sub>6</sub>, or petr. ether. With Ac<sub>2</sub>O and C<sub>5</sub>H<sub>5</sub>N, it yields I acetate, colorless needles, m. 116°. With CH<sub>2</sub>N<sub>2</sub> in Et<sub>2</sub>O, it gives colorless prisms, m. 109°. I (100 mg.), melted at 200° and vacuum-distilled at 0.015 mm. Hg and 210-50°, gave 50 mg. decarboxydidymic acid (II), m. 81-2° (petr. ether), gives no color with FeCl<sub>3</sub> and a blue-green color with CaCl<sub>2</sub>-EtOH, is soluble in most organic solvents. II (47 mg.), refluxed 2 h. with 2 mL. HI and 1 mL. AcOH, the solution poured into ice H<sub>2</sub>O, and the precipitate filtered and recrystd. from petr. ether-C<sub>6</sub>H<sub>6</sub>, gave 10 mg. decarboxynordidymic acid (III), m. 120°. III (20 mg.) kept overnight in 0.5 mL. C<sub>5</sub>H<sub>5</sub>N and 1 mL. Ac<sub>2</sub>O, precipitated in H<sub>2</sub>O, and recrystd. from dilute aqueous EtOH, colorless needles, m. 60-1°, soluble in C<sub>6</sub>H<sub>6</sub>, EtOH, and petr. ether. I (200 mg.) was added in portions to 6 g. KOH, 0.4 g. Zn dust, and 4 drops H<sub>2</sub>O, the temperature raised from 160 to 250° in 15 min., held 10 min. at 250-70° and 5 min. at 270-310°, the melt dissolved in H<sub>2</sub>O, acidified with HCl, extracted with Et<sub>2</sub>O, the Et<sub>2</sub>O

extract

shaken with aqueous Na<sub>2</sub>CO<sub>3</sub>, taken to dryness, and the residue recrystd. from H<sub>2</sub>O, giving 10 mg. C<sub>20</sub>H<sub>26</sub>O<sub>4</sub>, m. 155-6°, soluble in aqueous NaOH (red solution), EtOH, Et<sub>2</sub>O, and Me<sub>2</sub>CO, less soluble in hot H<sub>2</sub>O and C<sub>6</sub>H<sub>6</sub>. 3,5-(MeO)<sub>2</sub>C<sub>6</sub>H<sub>3</sub>Pr (IV) (1.5 g.) (C.A. 30, 6351.9) and 2.1 g. iodine in 50 mL. Et<sub>2</sub>O, treated with 1.5 g. HgO, shaken 7 h. for complete decolorization, filtered, washed with NaHSO<sub>3</sub>, KI, and KOH solns., and evaporated gave 0.9 g. 2,3,5-I(MeO)<sub>2</sub>C<sub>6</sub>H<sub>2</sub>Pr (V), oil, b<sub>8</sub> 150-60°. V (1 g.) and 2.5 g. Cu powder, heated 5 h. at 210-20° in a sealed tube, extracted with hot Me<sub>2</sub>CO, and the Me<sub>2</sub>CO-free residue distilled, gave 0.2 g. IV, b<sub>4</sub> 140-60°, and 0.1 g. 2,2'-dipropyl-4,4',6,6'-tetramethoxybiphenyl (VI), b<sub>0</sub>.06-0.08 200-10°. VI (0.1 g.) was demethylated with HI to 2,2'-dipropyl-4,4',6,6'-tetrahydroxybiphenyl, easily soluble in EtOH, gives no color with FeCl<sub>3</sub> and a fugitive violet-red color with CaCl<sub>2</sub>-EtOH. 2,2'-Dimethyl-4,4',6,6'-tetramethoxybiphenyl (VII) (8 g.), heated 6 h. on an oil bath with 58 mL. HI and a little red P, gave 2 g. 4,5-dimethyl-2,7-dihydroxydibenzofuran (VIII) and 4.5 g. 2,2'-dimethyl-4,4',6,6'-tetrahydroxybiphenyl, yellow leaflets from PhNO<sub>2</sub>, m. 232-3°. VII (4 g.) heated 4 h. on an oil bath with 75 mL. HI gave only VIII, colorless leaflets, m. 243°, soluble in Et<sub>2</sub>O and Me<sub>2</sub>CO, insol. in H<sub>2</sub>O. VIII (3.5 g.), refluxed 5 h. with 10 mL. Me<sub>2</sub>SO<sub>4</sub> in

50 mL. Me<sub>2</sub>CO and 20 g. K<sub>2</sub>CO<sub>3</sub>, gave 2.6 g. 4,5-dimethyl-2,7-dimethoxydibenzofuran (IX), colorless leaflets, m. 157°, gives no color with FeCl<sub>3</sub> and CaCl<sub>2</sub>. IX (0.1 g.) in 10 mL. C<sub>5</sub>H<sub>5</sub>N, treated 6 h. with 0.25 g. KMnO<sub>4</sub> in 10 mL. H<sub>2</sub>O on a boiling water bath, gave 0.05 g. 5-methyl-2,7-dimethoxy-4-dibenzofurancarboxylic acid, colorless needles, m. 181°, easily soluble in EtOH (blue fluorescence). IX (0.3 g.) in 10 mL. C<sub>5</sub>H<sub>5</sub>N, treated 15 h. with 3 g. KMnO<sub>4</sub> in 75 mL. H<sub>2</sub>O on a boiling water bath, gave 0.07 g. 2,7-dimethoxy-4,5-dibenzofurandicarboxylic acid (X), m. 321-2° (decomposition) (from p-dioxane), readily soluble in EtOH, less soluble in Et<sub>2</sub>O, shows intense blue fluorescence. X with CH<sub>2</sub>N<sub>2</sub> gave X di-Me ester, yellowish prisms, m. 188.5-9.5° (from EtOH), readily soluble in Et<sub>2</sub>O, shows blue fluorescence. II (0.11 g.), refluxed 3 h. in 40 mL. Me<sub>2</sub>CO with 4 g. K<sub>2</sub>CO<sub>3</sub> and 2 mL. Me<sub>2</sub>SO<sub>4</sub>, gave decarboxydidymic acid Me ether (XI), m. 31°. XI treated 13 h. in C<sub>5</sub>H<sub>5</sub>N on a water bath with aqueous KMnO<sub>4</sub> gave 0.02 g. yellow needles, m. 323° (decomposition) (from p-dioxane), mixed m.p. with authentic X, 322° (decomposition). The mixed m.ps. of X di-Me esters was also not depressed. I Me ether Me ester, m. 109° (0.1 g.), in 5 mL. C<sub>5</sub>H<sub>5</sub>N, refluxed 5 h. with 0.8 g. KMnO<sub>4</sub> in 20 mL. H<sub>2</sub>O, gave 0.02 g. yellow needles, m. 136° (from dilute p-dioxane) of 5-propyl-2,7-dimethoxy-3,4-dibenzofurandicarboxylic acid 3-mono-Me ester (XII), readily soluble in EtOH, Me<sub>2</sub>CO, Et<sub>2</sub>O, and p-dioxane, less soluble in petr. ether, shows no fluorescence. Saponification

of XII

and recrystn. of the product from petr. ether-p-dioxane gave the free dicarboxylic acid, m. 209-10° (decomposition), readily soluble in p-dioxane and EtOH, difficultly soluble in petr. ether and H<sub>2</sub>O. XII and CH<sub>2</sub>N<sub>2</sub> gave di-Me ester, yellow prisms, m. 130-1° (from petr. ether). Didymic acid is 4-amyl-5-propyl-2-hydroxy-7-methoxy-3-dibenzofurancarboxylic acid.

L18 ANSWER 86 OF 87 CAPLUS COPYRIGHT 2008 ACS on STN

AB Antibacterial effects of didymic acid and strepsilin of the dibenzofuran group of lichen substances and their derivs. were examined The antibacterial power of didymic acid is controlled by its dibenzofuran ring, its OH group, and the number of C atoms in its alkyl group. The strongest antibacterial power in lichen substances and their derivs. was shown by decarboxynordidymic acid (I). The highest dilns. inhibiting growth of *M. tuberculosis* (avian type) and *Staph. aureus*, resp., were: strepsilin < 1:10,000, < 1:5,000; didymic acid 1:40,000, 1:80,000; I 1:320,000, 1:640,000; diacetate of I -, < 1:5,000; 1,9-dimethyl-3,7-dihydroxydibenzofuran 1:80,000, 1:80,000; 1-methyl-3,7-dihydroxydibenzofuran -, 1:40,000; 3,7-dihydroxydibenzofuran 1:10,000,

1:5,000; 1,4,6,9-tetramethyl-3,7-dihydroxydibenzofuran <1:10,000,  
 <1:5,000; dibenzofuran -, < 1:5,000; 1,9-dimethyl-3,7-  
 dimethoxydibenzofuran -, < 1:5,000; 6,6'-dimethyl-2,2',4,4'-  
 tetrahydroxybiphenyl -, 1:5,000; orcinol -, < 1:5,000; olivetol 1:10,000,  
 1:10,000; sphaerophorol 1:40,000, 1:40,000.

L18 ANSWER 87 OF 87 CAPLUS COPYRIGHT 2008 ACS on STN  
 AB cf. C. A. 10, 2875. From 20 g. urushiol (A) in an equal amount of absolute  
 alc., 1.5 g. Na in 30 cc. alc. and 7.3 g. Me2SO4 heated 1 hr. on the H2O  
 bath, freed from the alc. by distillation, treated with H2O, extracted with  
 Et2O,  
 dried with Na2SO4 and distilled under about 0.2 mm. was obtained about 12 g.  
 oil, b. about 210° (260 g. total yield from 370 g. A); 250 g. of  
 this on repeated fractionation gave 4 fractions (about 208 g.) b0.15  
 172-200° (chiefly 183-8°), d425 0.9515-0.9606, Me (as MeO by  
 the Zeisel method) 3.78, consisting largely of monomethylurushiol (B); in  
 Et2O with H and Pt this gives monomethylhydrourushiol (C), needles from  
 MeOH, m. 44.5-5.0°, gives with FeCl3 in alc. a greenish blue color,  
 in H2O a yellowish brown precipitate gradually becoming red-brown. C can also  
 be  
 obtained in 1.5-g. yield from 3 g. dimethylhydrourushiol (D) boiled 5 hrs.  
 with 13 cc. HI (d. 1.7); only with boiling HI of d. 1.98 or by heating 2  
 hrs. at 180° with HBr (d. 1.78) could complete demethylation be  
 effected. Acetate of B, leaflets from dilute MeOH, m. 45.5-6.5°.  
 2,3-HO(MeO)C6H3Me (E) (2 g.) in 40 cc. of cold 88% alc. treated with 4.8  
 g. FeCl3 in 40 cc. H2O, diluted after 1 hr. with H2O to 600 cc. and  
 allowed to stand overnight in the ice chest gave 1.5 g.  
 3,3'-dimethyl-5,5'-dimethoxy-4,4'-diphenone (F), [O:C6H2Me(OMe) = ]2,

dark violet needles from absolute alc., m. 202-3°, requires 1 mol. SnCl<sub>2</sub> when titrated to complete decolorization in much almost boiling alc. in a CO<sub>2</sub> atmospheric; 2 g. suspended in 100 g. AcOH and treated with 2 g. Zn dust in small portions gives 1.9 g. of the quinol, colorless crystals from AcOH, m. 188.5-9.5°, repts. the quinone from alc. with FeCl<sub>3</sub>, mol. weight in boiling Me<sub>2</sub>CO 264-70; 1 g. heated 3 hrs. at 150° with 5 cc. HBr (d. 1.48) yields, 3,3'-dimethyl-4,4',5,5'-tetrahydroxydiphenyl, crystals from AcOEt, darkens 220°, m. 230-1° (decomposition) gives with FeCl<sub>3</sub> in alc. a blue color changing to violet-black, in H<sub>2</sub>O a black precipitate; tetraacetate, needles, m. 193.5-4.5°. 3,3'-Dimethyl-4,4',5,5'-tetramethoxydiphenyl (G), from 1.5 g. of the quinol in 2.5 g. alc. heated 5 hrs. at 120° with 0.3 g. Na in 4 cc. alc. and 2.5 g. MeI, leaves from dilute alc., m. 102-3°. 2,3-(HO)2C6H3Me (H) (2 g.) in 250 cc. cold H<sub>2</sub>O treated in the course of 1 hr. with 5.25 g. FeCl<sub>3</sub> in 100 cc. H<sub>2</sub>O and stirred 20 min. longer gives 1.6 g. of a substance, (Cl<sub>2</sub>H11O4)2Fe, as a blue-black precipitate indifferent towards NaOAc, soluble in alkalis with dark green color, easily reduced in AcOH with Zn dust, the colorless solution, on evaporation in vacuo in CO<sub>2</sub> and boiling 3 hrs. with Ac<sub>2</sub>O giving G; the compound is assigned the structure: In the same way, 1 g. hydrourosiol in 75 cc. cold alc. with 1 g. FeCl<sub>3</sub> in 250 cc. H<sub>2</sub>O gives 0.75 g. of a compound (C<sub>42</sub>H<sub>6</sub>7O<sub>4</sub>)<sub>2</sub>Fe as a blue-black precipitate C similarly oxidized gives a diphenoquinone, red-brown crystalline precipitate, m. 120-2°, reduced by Zn dust in AcOH to the quinol, m. 80-1.5°. Finally, 0.1 g. E with laccase in 20 cc. alc. and 40 cc. H<sub>2</sub>O treated with air becomes orange, then red-brown, and finally deposits black-violet needles of F (the reaction is complete in 10 hrs.). H treated 1.5 hrs. in H<sub>2</sub>O with air practically does not change but on addition of laccase gradually gives a brown precipitate which does not m. 280° and becomes dark brown in alc. with FeCl<sub>3</sub>; with Zn dust in AcOH it yields a yellow powder m. 150-60° which is apparently the impure tetraacetoxidytyl. These facts confirm M.'s conclusion that A is an analog of H, viz., 2,3-(HO)2C6H3Cl<sub>5</sub>H<sub>2</sub>7.

AB A Hsp90 family protein inhibitor which contains as an active ingredient a benzene derivative represented by the following general formula (I), a prodrug thereof, or a pharmacol. acceptable salt of either.  
 IT 860157-53-5P  
 RL: RCT (Reactant); SPN (Synthetic preparation); PREP (Preparation); RACT (Reactant or reagent)  
 (4-[3,5-bis(benzyloxy)-2-ethyl-6-phenylphenyl]-2-(methoxycarbonyl)but-2-enoate Me ester; benzene derivs. as Hsp90 family protein inhibitors and antitumor agents)  
 RN 860157-53-5 CAPLUS  
 CN 2-Butenoic acid, 4-[3-ethyl-4,6-bis(phenylmethoxy)[1,1'-biphenyl]-2-yl]-, methyl ester (CA INDEX NAME)

II

AB The title compds. I [wherein n = 1-10; R<sub>1</sub> = H, OH, CN, etc.; R<sub>2</sub> = (un)substituted alkyl, alkenyl, alkynyl, cycloalkyl, aryl, or heteroaryl;

R3 and R5 = independently H, (un)substituted alkyl, alkenyl, etc.; R4 and R6 = independently H, OH, halo, CN, etc.] or prodrugs or pharmaceutically acceptable salts thereof are prepared as heat-shock proteins (HSP) 90 inhibitors. For example, the compound II was prepared in a multi-step synthesis. II inhibited >30% human HSP90 at the concentration of 10  $\mu$ M. I are useful as antitumor agents (no data).
